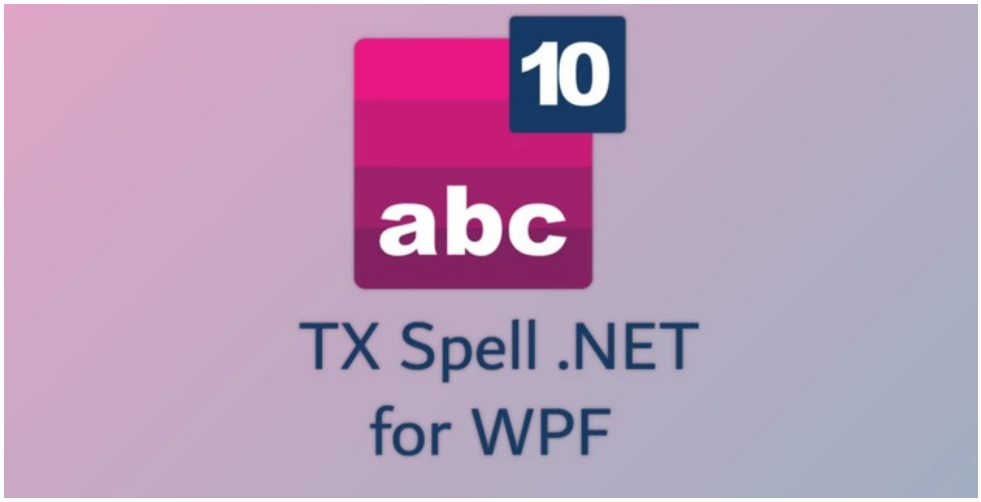
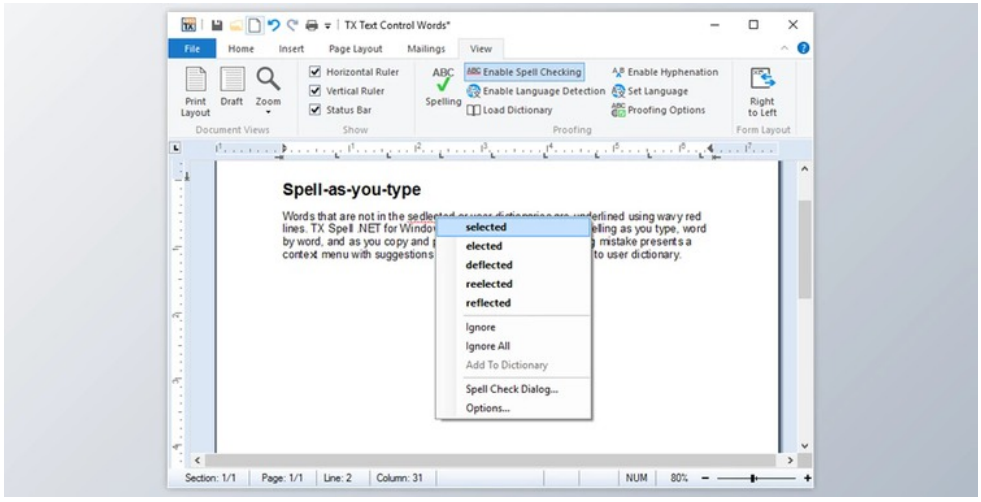
TX Spell .NET for WPF v10.0.1

2026-08-26 15:26:44





TX Spell .NET for WPF Client Software is this going to be a very powerful spell checking as well as language tool which is present for the software of WPF. TX Spell .NET for Win Forms and ASP.NET can check the spelling whenever the user types word by word and as the user tries to copy and paste. The TX Spell .NET for the WPF can support the high setting of the DPI which can make the development process for the 4K plus screen easily and flexible for older users and developers. All the complement just like the toolbars, rulers as well as potatoes bars and at the same time the ribbons can support higher resolution and the dictionary performance, in this case, is described to be having decreased the loading time as well as the memory footprints significantly for the user dictionaries that are already loaded. It can support as well as monitor the setup which is multiple wherever every display has a different factor for scaling. The application in this case is moved from one display to another by the user and developer. It should be added that the TX Spell .NET for the WPF can provide a new option to hide the dictionary that is added but they are not displayed in the dictionary dialog boxes and hence they cannot be edited or even modified. It can provide users and developers with different methods to hyphenate words in the documents that are multilingual.

The features and attributes of the TX Spell .NET for WPF:

It has the following features and attributes that are stated below such as:

- **It has over 60 dictionaries** for the user and the developer which is free and hence we can see the American English which is shipped as standard and the user does not have to pay any extra for the languages additionally. The unrecognized boards, as well as their vocabulary such as the legal order medical terms, can be later added to the user dictionary, and to assist the end-user to maintain the dictionary it has the ability to ship with the user dictionary as well as the editor.
- **Hyphenation support** is a method that is provided to the user and the developer to hyphenate the words in the documents that are multilingual. It can return the point of hyphenation for words that are defined and whenever they are connected to the TX Text Control it can work automatically based on the language origin which is now in the text control.
- **Integrated dialog boxes** permit the user and the developer to see the words that are incorrectly spelled or even ignore them completely. The option of the spelling mistake and the dialog box premise the user and developer to specify what kind of word should be ignored and repeated and the repeated words should be considered as a spelling mistake or not.

Components .Net WPF

- **The language detection engine** can support the process of language detection and the language scope which is given in more than 30 languages and they can be detected. The algorithm in this case is capable of supporting the nested scope just like the bracketed text or even the bi-directional text in different mixed languages for the users and developers. The language scope can be defined with the use of the selection and it is based on the language which is detected and the proper dictionaries can add the dictionary collection for the hyphenation list to be loaded.
- **Multi-lingual spell checking** has the ability to check a document that contains German, English, French as well as Spanish text without even having to manually switch the dictionaries.
- **Spell as you type** is a feature that is provided to the users. The words that are not in the user dictionaries are on their light basically by Red Line and whenever the spell checking happens as the user types word by word and as the user copies and pastes. On the spelling mistake which is present, the user can right-click and a menu along with the suggestion of the options to ignore all or add to the user dictionary will pop up.

It can utilize the TX spell .NET to the WPF and the user can add extremely fast as well as highly reliable and entirely accurate spell checking for the TX text control based applications easily and flexibly.
