KDTele Tools v4.34 for Delphi Full Source

2026-10-14 13:24:32

KDTele Tools is a project to create simple-to-use, flexible and powerful collection components for telephony applications development. You can choose from a Basic Module or a variety of Add-On modules. The Basic Module contains essential components to telephony, while the Add On Modules provide additional capabilities.
Data Add-On
Create computer-to-computer file exchange and data applications. Support ZModem file transfers protocol and file compression/encryption.
Fax Add-On
Include fax capabilities in your application.
Multi-Calls add-on
Multiple telephone lines can be accessed simultaneously
Speech add-On
Your application can now include voice recognition and voice synthesis.
Wave Editor Add-On
Your application and your end-users can view/edit sound files.

KDTele Tools allows programmers to add powerful features such as voice recognition, image editing, file compression/encryption, and wave sound editor to their software.

KDTele Tools: Great Features

- Answer incoming calls and make outgoing calls.
- Calls that are in progress can be picked up.
- You can play and record audio using the phone line or soundcard.
- End-users can navigate using the phone's buttons by pressing the buttons.
- Capture caller ID.
- Multi-line support.
- The local handset can be controlled.
- The modem's external microphone and speaker can be controlled.
- Hardware independence. KDTele Tools can be used with any /TAPI-compatible telephony device.

- You can play and record audio using the phone line or soundcard.
- When recording, Silence detection is enabled. KDTele Tools includes a built-in algorithm to make the Silence Detection Mechanism accessible to any TAPI-compatible telephony device.
- You can track the progress of recording and play by setting timers.
- Multiple buffers allow for playback and recording.

- Graphically display wave files
- Wave files can be edited (copy, cut and paste, delete, insert another file, copy to a different wave file, or copied to a new one).
- Graphically, the developer or the end-user can define a selection range, a position point, and the minimum and maximal limits for the position.

- Faxes can be sent and received.
- TIFF files can be used transparently to send and receive faxes. To send or receive faxes, there is no need to convert to an internal type of file.
- Temporary texts can be written on outgoing fax pages (e.g., a page header that displays the current date/time and page number).
- To view and edit fax documents, use the KDImage component.

Delphi Components VCL

- KDImage is an image editor that can be used to edit TIFF and BMP files.
- You can use it to view and edit fax documents that KDFax transmits.
- A comprehensive set of commands for editing or viewing fax documents: zoom, print; undo/redo the last 20 steps; insert the picture, rotate, etc.
- Your program should allow the user to do several actions with their mouse.
- This tool allows you to create an image document completely from scratch using a variety of auxiliary functions.
- Allows multiple images to be stored in one TIFF file
- KDImage supports scanners as well as other image capture devices.

- You have full control over the serial port device.
- Built-in buffer to store and manage inbound data
- There are many options for processing inbound data.
- ZModem is a file transfer utility.
- Multiple file transfers with error correction
- Resumable file transfer is supported. This allows file transfers that were interrupted to be completed on the next connection without the need to retransmit the entire file.
- Use file compression and encryption software.
