

DtSearch Desktop & Engine v2025.02 Build 8845 for Win & linux & macOS Retail

2026-04-03 11:15:03

DtSearch products offer instantaneous searches across terabytes of text within various online and offline information types. Search times are typically under seconds, paralleling the current search period. These products achieve swift searches by creating a search index that stores each unique word and its location in the data. A single index can accommodate up to a terabyte of data, spanning multiple directories, emails, attachments, online data, and other databases. Users can effortlessly build and search different terabyte indexes by pointing to the desired folder or online location.

The indexing process is straightforward, involving the selection of folders or online locations for indexing. products facilitate automated indexing through the Windows task scheduler. SignifiIndexing, searching, and document display do not alter the original data or files. For index updates, **DtSearch** informs users by adding new or updated items, removing deleted items, and compressing the index without disrupting the search process. Index updates can be scheduled through the Windows task scheduler, ensuring it doesn't lock out individual or concurrent search processes.

Key Features of DtSearch Desktop & Engine:

- Versatile Operating Environment:** The dtSearch Desktop with the spider and the dtSearch Network with the spider operate seamlessly in a Timeless window environment, accommodating shared and individual network-based searching.
- Concurrent Network Searching:** DtSearch Web, coupled with the spider, excels in Internet or intranet environments, offering unlimited search concurrency without limitations.
- Platform-Specific SDK Versions:** The dtSearch Engine Programmer SDK is available in distinct versions tailored for different platforms, ensuring compatibility and optimal performance.
- Server-Side Multi-Threading Support:** The dtSearch Engine operates effectively in internet and intranet server environments. It supports robust multi-threaded searching processes without restricting the number of parallel search
