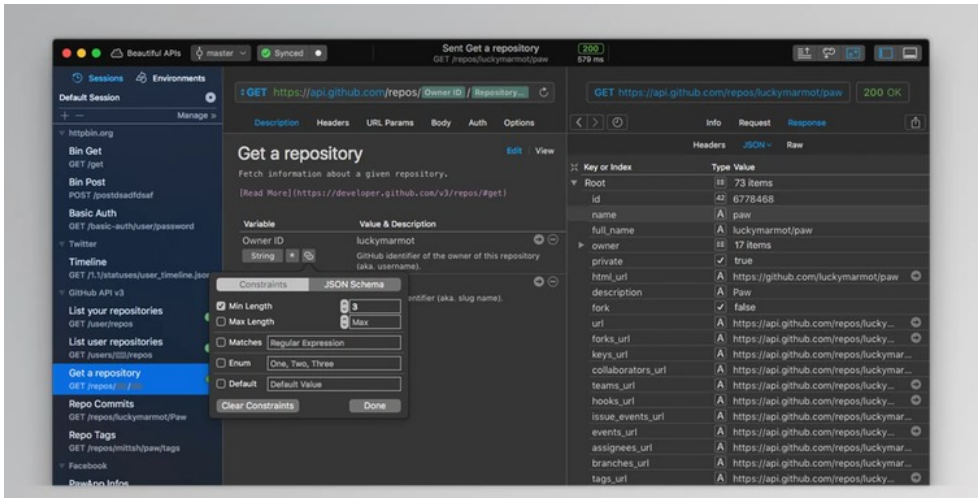
Paw HTTP Client v3.3.5 for macOS

2024-12-18 23:01:45



Paw is a fully-featured HTTP client that allows you to examine and define the APIs you design or consume. It offers a beautiful native macOS interface that allows you to compose requests, view server responses, create client code, and export API definitions.

HTTP Client

Send all sorts of HTTP requests! Try and test your APIs or discover new APIs. Paw is a fully-featured visual editor as well as HTTP tools.

API Description

Define your API during the time you are testing the API. Paw natively allows JSON Schema and is fully compatible with Swagger and RAML descriptions.

Teamwork

Make sure everyone is on the same level. Make sure you sync all of your API tests, apply changes that are not conflict-free and receive real-time updates.

Paw HTTP Client with Great Features:

Creating great software can be difficult, and the tools used by developers can help without the hassles. Paw is exclusively developed on macOS, and you can master it. Each feature is built with a straightforward and intuitive approach using keyboard or mouse shortcuts.

- Paw can support OAuth 1 & 2, Basic Auth, Digest Auth, and Amazon S3.
- Paw creates client codes that are ready to use.
- Set up your preferences and switch between environments
- Make your requests easy to build with dynamic values and formatting
- Check the response and request information as well as headers and body
- View raw or formatted requests and responses to HTTP
- JSON outline editor and viewer
- Request List

  Create environments and requests

- Request Builder

  Visually create your requests. Check out the HTTP message, as well as the generated client code.

- HTTP Exchange

  Check the response of the server, as well as the information you've provided

This is the reason that is what makes Paw genuinely distinctive! Get access to information from previous responses, such as authentication tokens, compute hashes signatures and randomize data to test, math, or whatever else you'd like to do.
