Applications   Tools
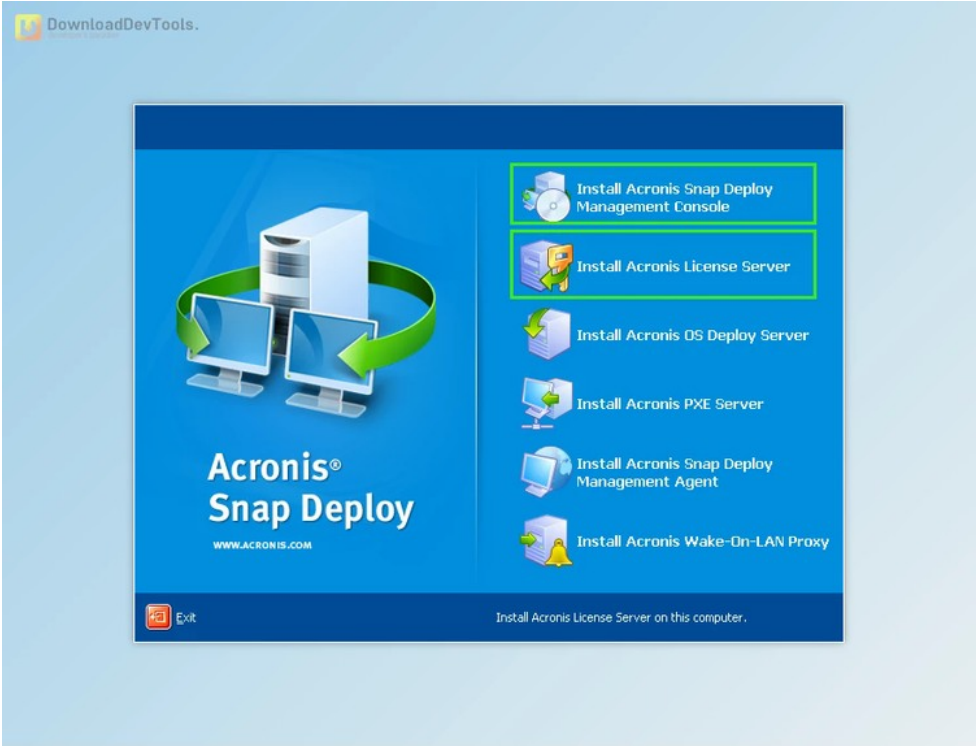

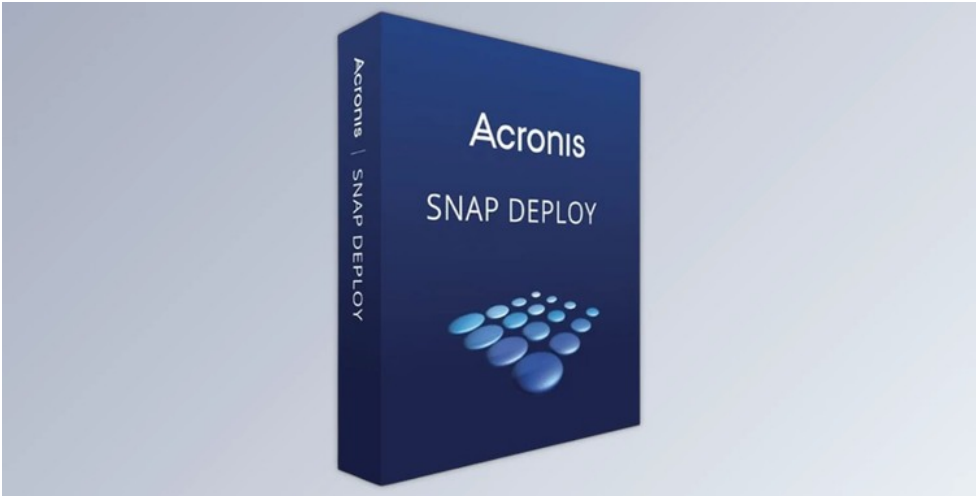

Acronis Snap Deploy provides a comprehensive deployment solution, enabling the swift provisioning of hundreds of systems with the same efficiency as provisioning a single one. This all-in-one deployment tool allows users to create an exact disk image of a standard configuration, encompassing the operating system, settings, files, and applications. This image can be simultaneously deployed to multiple machines through a single, streamlined process, significantly increasing operational efficiency.

With , the automation of provisioning new operating systems and software to numerous systems becomes a time-saving and effortless task. This solution ensures the creation of consistent environments, reducing configuration errors and guaranteeing that all deployed systems are secure, free from malware, and up-to-date. Ideal for both rapid bare-metal initial deployment and ongoing redeployment to existing live machines, **Acronis Snap Deploy** simplifies the management of deployments, providing a robust and user-friendly experience.

Key Features of **Acronis Snap Deploy**:

1. **All-in-One Deployment Solution:** Acronis Snap Deploy facilitates the simultaneous deployment and provisioning of numerous servers and workstations with the efficiency of provisioning a single system.

2. **Operational Efficiency:** Save time and effort by automating the provisioning of new operating systems and software to thousands of systems simultaneously, ensuring quick and reliable deployments.

3. **Complete and Consistent Environments:** Reduce configuration errors and guarantee secure, malware-free, and

up-to-date environments across all deployed systems.

4. **Effortless Management:** Ideal for both rapid bare-metal initial deployment and ongoing redeployment to existing live machines, providing a user-friendly experience for managing deployments.

5. **Flexible Deployment Options:** Choose from manual, automatic, user-initiated, standalone, or scheduled deployment to machines running Windows or Linux.

6. **High-Speed Dispatch:** Rapidly deploy a single image to multiple machines via unicast or multicast from a centralized management console, whether connected to LAN or WiFi networks.

7. **Machine-Specific Configurations:** Customize configurations and assign settings to individual machines, monitoring their status and pre-configuring new devices based on their MAC address.

8. **Dissimilar Hardware Support:** Provision the same image to dissimilar hardware, even simultaneously, utilizing Acronis Universal Deploy technology, eliminating the need to configure a new master system for each hardware type.

9. **Efficient Image Management:** Create an exact disk image of a standard configuration, including the operating system, settings, files, and applications, streamlining the deployment process.

10. **Automation:** Automate the deployment process for increased efficiency, allowing for the swift provisioning of systems without manual intervention.

11. **Security and Up-to-date Environments:** Ensure that all deployed systems are secure, free from malware, and regularly updated to maintain a consistent and reliable computing environment.

12. **Versatile Deployment Scenarios:** Suited for various deployment scenarios, including initial deployment and ongoing redeployment, providing flexibility to meet diverse provisioning needs.
