The C# library **IronPPT** is a robust and user-friendly solution for manipulating Microsoft PowerPoint and management tasks. This library enables developers to work with PowerPoint files through creation and editing functions without requiring Microsoft Office and Interop. The speed-oriented framework easily connects with .NET programs to offer a service that supports web applications alongside mobile and desktop development needs. IronPPT enables users to handle PowerPoint files through .NET versions 9 to 6 and Core and Framework together with Azure and 7 and 8.

The library functions across different platforms, spanning Windows, Linux, macOS, iOS, and Android. The system functions with different development platforms, ranging from Blazor and WebForms web applications to Xamarin and MAUI mobile solutions alongside WPF and MAUI desktop software. The **IronPPT** library allows developers to create compatible applications that work on Windows servers with Docker containers and the cloud platforms of AWS and Azure. All developers can access this tool because IronPPT has optimized its functionality for C#, F#, and VB.NET development languages.

handles PowerPoint processes easily through a minimalistic API that enables users to modify slides and text appearances while adding photos and transforming forms. The API lets users modify slide layouts and control their presentations efficiently while producing high-quality professional outputs. This tool functions with DigiCert Signed Binaries to maintain enterprise-level reliability and security. Through its API service, IronPPT enables efficient and fast PowerPoint automation even when developing reports or presentation tools.
