DIXml v8.0.1 (25 Jul 2025) for Delphi 11-12 Athens

2025-08-11 20:45:44

DIXml serves as an embedded XML, XSLT, and EXSLT processing library designed specifically for Delphi (Embarcadero / CodeGear / Borland). Utilizing the libxml2, libxslt, and libexslt libraries, it boasts a feature-rich architecture without the dependency on external DLLs or additional files.

As Delphi's most comprehensive XML and XSLT solution, **DIXml** offers versatile functionality, including XML and HTML reading and writing in both pull and push parser modes, document tree creation, traversal, loading, and saving. It incorporates SAX and extended reader interfaces, supports DTD and schema validation, and provides encoding support for

various standards.

With capabilities like XPATH processing, NameSpace support, and XSLT transformation, ensures efficient and dynamic XML processing. Its flexibility extends to file, memory, and customized input/output options, showcasing low memory usage and outstanding performance. It makes it an efficient choice for developers seeking robust XML and XSLT processing in their Delphi applications.

Key Features of DIXml :

1. Embedded XML, XSLT, and EXSLT processing library for Delphi.
2. Built on libxml2, libxslt, and libexslt libraries, eliminating the need for external DLLs.
3. XML and HTML reading/writing in pull and push parser modes.
4. Document tree creation, traversal, loading, and saving capabilities.
5. Support for SAX and extended reader interfaces.
6. DTD and schema validation for ensuring document integrity.
7. Encoding support for UTF-8, UTF-16, ISO-8859-family, and ASCII (all native).
8. XPATH processing for efficient querying and manipulation of XML data.
9. NameSpace support for structured XML documents.
10. XSLT transformation and processing for dynamic content generation.
11. Flexible input/output options, accommodating file, memory, and customized data handling.
12. Demonstrates low memory usage and exceptional performance in XML and XSLT operations.
