Mobile Permissions Component for Android v2.1 (06 Mar2023) for Delphi Full Source

2024-12-18 23:02:15

This component's primary purpose is to facilitate the request for resource permissions on Android. With just a few lines of code, it is possible to facilitate this work in mobile Android applications.

This is a component made to turn easier to request permission in Android 8.x or later.

The MobilePermissions component was developed to facilitate the request and granting of permission to the operating system resources the application needs. We seek to make the life of the Delphi Mobile developer simpler.

We translate all the permissions provided for in Project > Options > Application > User Permissions to the component, so the developer will not need to enter the project settings window to mark the permissions he wants to request, drag a MobilePermissions component to the Form and mark the properties What do you want.
