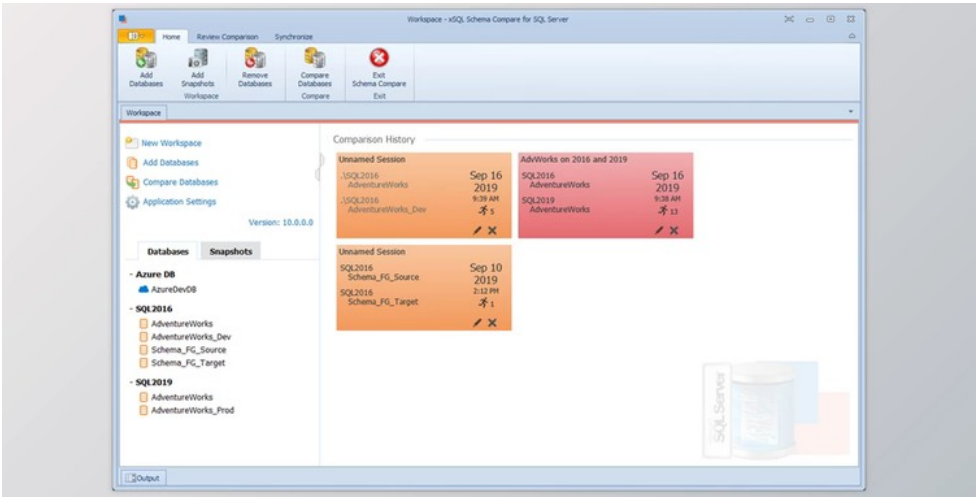
xSQL Bundle for SQL Server v11.1.0.0 (23 Apr 2020)

2025-02-04 22:23:03



A builder is a tool that lets you push schema changes in the central database into a single or multiple customer databases. Client databases may be disconnected in the database; they might be running a different version of SQL Server they are hosted on-premise or around Azure.
The end item of Builder is an executable bundle with all the schema upgrades embedded inside. After the program runs on the client machines, it contrasts the database onto the device using a photo of the master database embedded inside. It describes schema differences between both and synchronizes them.
The builder was made to operate by users with little database experience. The bundle that Builder creates is self-explanatory, without external dependencies aside from the .NET frame. All tools that Builder should synchronize to the customer database are embedded inside this package.

Schema Assess for SQL Server

Synchronize that the schema of SQL Server Databases, on-premise and on Azure: Quick, secure across variations, lots of options, and only a few attributes of this Schema Assess for SQL Server. An easy user-interface permits you to quickly and economically accomplish all of your jobs; a detailed command line together with the command line magician performs the same operations in batch files or on programs.

Data Assess for SQL Server

Synchronize the information of SQL Server Databases, on-premise and on Azure: Assessing views and tables, easy and intricate types, a couple of rows or countless, information compare will find the job that the done. Saved sessions, information gaps, control line, control line magician, and complete support for many SQL Server variations, comprise Azure Databases. These are a few of the features in Data Compare for SQL Server.

Schema Assess SDK for SQL Server

Integrate schema contrast on your apps with our Schema Comparison SDK: Comprehensive, quickly with a tiny footprint; Schema Compare SDK is your frame that powers all our tools. We made it accessible, so you may use it to execute schema contrast on your app with only a couple of lines of code. Tested extensively through time, Schema Compare SDK supports each version for SQL Server, beginning with SQL 2005, such as the most current Azure Databases.

Tool for SQL Server

Create executable packages from a master database and then deploy them for your own users: Imagine if you had tens of thousands or perhaps hundreds of consumers, a number of these on distant locations without a dependable link to the head; how can you push schema modifications to their own databases? Utilize our Builder for SQL Server. Builder performs this task by taking a photo of your master schema and creating an executable bundle, together with the photo embedded inside. The executable bundle code contrasts the master photo with the consumer database and synchronizes them on the consumer machines. It's that easy.

Profiler for SQL Server

Trace, gather, filter, and analyze database occasions on a single or many servers concurrently: Profiler expands the tracing capabilities of SQL Server by monitoring many resources simultaneously, including strong filtering standards, allowing scheduled and precise data collection, to list a few capabilities. Give it a try now.

Script Executor - Free for Personal Use

Builds and executes script packs against one or several databases: Script Executor lets you create bundles, including

所有软件资源 100%安全 已检测 无病毒 无篡改

Tools Database

SQL scripts, and execute them interactively from the UI or batch files through the command line. Constraints may be added to division the script implementation logic based on if or not a step finishes, fails, or succeeds. It is also possible to create executables and run them in machines that don't possess the Script Executor installed. Supports SQL Server, DB2, and MySql databases.

Documenter - Multi-Platform

Comprehensive, uniform, and easy-to-navigate database documentation: The documenter creates database documentation in HTML or CHM (compiled help) format. Above all, it supports the majority of the database management systems in existence now. You can extract remarks directly from the data source, create DDL statements for just about any item, and include charts built from dependencies and main key/foreign key connections.

RSS Reporter

Create RSS feeds from the own data: Although RSS standard isn't quite as popular as it was; nevertheless, it's a compact and well-known format that might be used for your own data. Through a straightforward web interface, RSS Reporter can create Atom and RSS feeds out of any SQL query. Additionally, it contains a couple of built-in feeds, like the SQL Server tasks, the work implementation history, database allocated dimensions, and much more.

Database Searcher

Look for SQL Server databases' schema: Searcher is a wonderful little tool that's supplied to you without a cost. It hunts the title and proprietor of database items, the definition of stored procedures, views, triggers and functions, SQL Server tasks, and much more. You can run it by Yourself or as an add-in for SQL Server Management Studio. Give it an attempt to, in case you prefer to add attributes to it, then please inform us.
