RemObjects Data Abstract v9.2.101.1295 for Delphi Full Source

2025-04-14 12:44:51

Data Abstract is your best frame for constructing **quick**, **protected,** and **dependable database software**.

Employing the multi-tier strategy, Data Abstract enables us to apply business logic, access rights, and information consistency from your machine, without exposing your database straight into the community.

Using its distinctive Schema™ version, Data Abstract enables you to, cough, and abstract the very simple implementation information of your own physical database from client software. Utilize a unified data access API, regardless of what database type you join to.

Data Abstract libraries can be found for a broad assortment of platforms and encourage virtually all contemporary database types.

Data Abstract utilizes a multi-tier method of information access, making information access simple, fast, and secure to the modern internet world.

On the server-grade, you have complete control over the information is accessed and altered, making certain client applications can't skip your rules or render information in an unpredictable state. And all that without needing to write and keep a server program yourself.

Your client program, Data Abstract provides a simple yet flexible API making it simple to ask for data, change it, and ship it back to the host -- immediately or afterward. All without messing with HTTP requests, REST, or comparable low-level execution details.

Data Abstract enables you to utilize **archives** to make information accessible on the regional program, even if the consumer isn't on the network. You may also allow the user to make adjustments to the information, and upload them at a subsequent moment.

Data Abstract also fully **abstracts off the nitty-gritty details** of working with assorted database back-ends. While you *may* get your hands dirty and like to write custom SQL queries on the machine, your client programs will remain completely database.
