IdeaBlade DevForce 2012 Universal v7.5.3

2026-09-11 10:49:06

DevForce implements an n-tier architecture that is end-to-end. It works by exposing a web service that exposes on the server. This takes a LINQ expression, returns business objects to clients over the internet, and returns them.

You can write LINQ queries to the client and get back business objects using your custom business logic. This is just like working with a client-server or 2-tier application. DevForce manages all the n-tier WCF communications and serialization.

DevForce manages your application's infrastructure. This is the gap between your data layer and the client layer. It's where the hard work of turning raw data into business objects and moving them to the client's screen takes place. DevForce takes care of this for you. Instead of worrying about your application's infrastructure, you can instead focus on your love application development.

DevForce implements an end-to-end ntier architecture. It exposes a generic web service on the server that accepts a LINQ expression, returns business objects to clients over the internet, and takes a LINQ expression.

You can use LINQ queries to query the client and return business objects using your custom business logic, just like you would with a client-server or 2-tier application.

DevForce manages all of the n-tier WCF communications and serialization for you.

IdeaBlade DevForce Great Features:

DevForce Universal allows you to reach any user anywhere. Our impressive features make it easy to build desktop, mobile, and Web applications and deploy them to all of today's most popular client platforms.

Build your application with DevForce and use your server-side code to drive multiple front-end clients. This makes it easy to standardize your development environment onto a single framework and lets developers move seamlessly across projects.

A single domain model enables all client technologies to work with a shared domain model, making it easy for you to develop, test, and deploy your applications across different client types because of code reuse.

Protect your investment against future changes and the introduction of new technologies. Whether it's WPF today and HTML/JavaScript tomorrow, DevForce protects you from costly rewrites in today's rapidly changing world.
