# JVEsoft Suite - Analytics Pack with Full Source Code

2026-10-12 22:51:43

It is crucial to keep track of how your app performs to allow you to iterate quickly and make it more efficient for your customers. Analytics is essential for any successful app, and obtaining good ratings for your app on the app store is also essential. The Google Analytics API wrapper and App rating components will assist you in achieving success with your Delphi Firemonkey application.

## JVEsoft Suite - Analytics Pack Great Features:

Google Analytics is a free service provided by Google. It was initially designed to monitor the number of page views, unique visits, and views on web pages. It has since been developed to permit tracking information about mobile app usage. The component TJVEAnalytics is an extension of this feature. It automatically gathers various kinds of information using the various JVE components if you employ them in your application.

The TJVEAppRater component lets you encourage users to visit your application page on different app stores and rate your app. App ratings are crucial as when a person downloads your app, one of the first things they are looking at is your app's ratings. With TJVEAppRater, you can ask those who like your app to give a rating to the app. TJVEAppRater is compatible with Android, IOS, and Mac stores.
