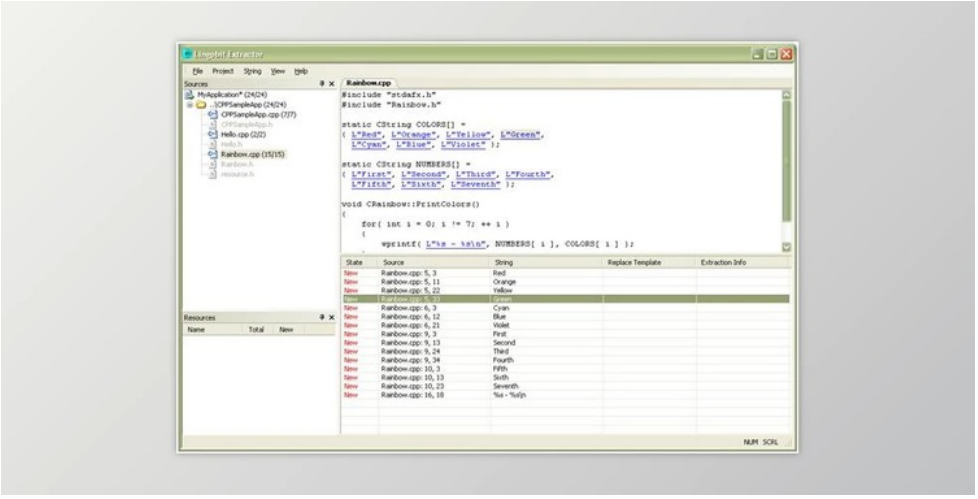
# Lingobit Extractor v2.1.8445

2025-01-06 23:13:27



Lingobit Extractor is a brand new tool for software localization. This tool simplifies a massive portion of internationalization activity by **yanking hard-coded strings** from source code into sources.

- Automatically **extracts hardcoded strings**
- Extracts only" **that the ideal strings**"
- **Creates a source file** with extracted strings
- **Upgrades** hardcoded strings after the software upgrade
- Works with personal **documents and folders**
- Runtime **preview** of source code documents
- exceptionally **customizable templates**
- Inspection and editing of pulled strings
- Supports C/C++, C#, Java, Visual Basic.NET, WPF, Silverlight, XAML, and Delphi.

While Lingobit Headphone performs roughly 95 percent of its job, the application makes it simple for you to inspect that strings need to and should not be transferred to the source file. There are a whole lot of configuration options so that you can control each phase of the extraction procedure. Moreover, you may preview all modifications in the source code and then edit optical strings in the source table.

It's quite a practical tool for applications programmers, translation and localization agencies, and other businesses that confront software localization challenges. It simplifies the hardcoded string extraction procedure and makes it rather simple to prepare source code for software localization.
