ArmDot .NET Obfuscator v2025.5.0 (28 Feb 2025)

2024-12-27 08:52:27

ArmDot is a .NET encryption tool to safeguard programs written with .NET.

Businesses need to safeguard their intellectual property, which includes the source code for their algorithms, products, and the resources they use.

However, .NET compilers produce a generally accessible code.Resources embedded in the code are readily accessible, and all string literals are open. Method and class names enable anyone to comprehend the code quickly.The process of obtaining your source code out of the intermediary code is a matter of seconds!Obfuscation-free code is identical to placing the source program's code into open access.

This is the moment when ArmDot comes to your rescue with its full arsenal of techniques for obfuscation, beginning with the standard but a highly effective change of metadata names: the names of methods, classes, and properties, and finishing with the latest method - code virtualization which makes deobfuscation extremely complicated.

ArmDot .NET ObfuscatorGreat Features:

ArmDot gives you the complete variety of obfuscation methods:

- changing the names of the types, fields, methods, and properties;
- control flow obfuscation and control flow;
- code virtualization;
- encryption of embedded resources;
- string literals encryption.

ArmDot completely supports old runtimes such as .NET Framework 2.0 and the more modern .NET 5.

The following runtimes are supported by the following:

- .NET
- .NET Core
- .NET Framework

The program supports .NET Framework, .NET Core, and Mono.

Obfuscates all kinds of applications, including Windows Forms, WPF, and Xamarin.

Offers a complete API for issuance, blocking, and verifying serial keys.

Embeds any file, including unmanaged and managed Data files, DLLs, and other assets, into a .NET assembly.

ArmDot is a genuine cross-platform .NET Obfuscator developed within .NET Core that works on Windows, Linux, and macOS.
