madCollection v5.0.0 support D10.3 Rio Full Source

2026-10-04 21:23:44

This isn't your everyday VCL component set. You won't see many brand-new colored icons from the component palette. My bundles do not offer you many visual elements to perform. But if you anticipated that!

My bundles are about non-toxic materials, for the most part, together with as simple handling as you can. To locate the hidden treasures, you'll need to look at the documentation (you are reading only at present). Afterward, I plan to write some fine demos, but the documentation has to be sufficient to get you started for today.

Allow me to present all the various bundles to you. To start with, we've made basic, which implements (as the name implies) some simple things. The rest of the packages require madBasic. It includes some instrument functions like message management, compression, encryption, and many quite speedy chain functions.

The following bundle to say is madDisAsm, a tiny disassembler, which may analyze binary code in any memory place and tell you a few things about it.

Among my favorites is madExcept, which replaces Delphi's exception handling with a far more apt solution. With madExcept incorporated into your own projects, you'll receive detailed bug reports from the clients, which should directly allow you to discover and fix your issues.

If you need to get to other procedures, you ought to take a peek at madRemote. With this package, you'll be able to allocate memory from different procedures, you can copy whole functions to additional procedures, and also, you may create threads in different processes.

The bundle madKernel makes coping with threads, processes, and these sort of things really simple. There is a good deal of undocumented material hidden in madKernel, like converting handles to IDs or enumerating"key" things.

Ultimately, among the finest available general-purpose API hooking bundles is here, specifically madCodeHook. It combines the most effective available hooking methods using the simplest possible use.

Perhaps you have attempted sharing a folder at both win9x and WinNT? Both OS households have completely different API sets. It is really a wreck. With madSecurity, all of it gets easier. You do not have to take care of the operating system family; madsecurity even emulates ACLs and ACEs from win9x to make your life simpler.

Some pleasant things are included in madShell, also. It encapsulates the main shell COM objects, which makes them a lot simpler to use.

MadCollection Great Attributes:

· complete support for XE compiler
· complete Unicode support
· FogBugz, BugZilla and Mantis reporting
· SSL and TLS SMTP customer mailing
· SSL HTTP archiving
· memory and resource flow coverage
· Enhances memory manager
· brand new madExceptViewer instrument
· service for nested exceptions
· Windows Logo compliance
