Dotfuscator is a .NET Obfuscator and a lot more can be included in it. It is ready to supply the app's security, by significantly reducing chances of the piracy as well as tampering. The ultra-expiry as well as the encryption, followed by the watermarking, anti-Debug, anti-tampering, and protection as well as alerting the technologies to offer protection for thousands of programs all over the world. All the .NET libraries along with the applications are compiled in the Microsoft Intermediate Language or popularly known as MSIL. The Microsoft Intermediate Language maintains the information regarding the code of the user such as the parameter names, addresses, class, methods, properties, decompile, and many more. When the person uses a complete free decompile, it is very simple and easy for him to recreate the source code. The relevant methods can make it more confusing and hard for the user for the rival or a hacker to reverse engineer the user's application. It has powerful protection and the Dotfucator's .NET end run time has been protecting thousands of programs for the users for more than 10 years so that the users worry about anything. They invest in the Security and Research danger and their defense it's always updated. In this case, there is no need for consultants, and guarding do users' program does not need an army of advisors and Consultants. It is very much possible to create the protected construct in a fraction of minutes by the users and then the protectors after extensive documentation. The doctrine guarantees that the defaults are also secured for the user's program today as well as in the long run. They provide world-class service to all users. They have based in Europe as well as America and the service engineers have observed it from the problem configuration which has been solved to the .NET bugs that create a lot of workarounds. The clients give great ratings to this and they love the service as their privacy is being secured and protected.

Dotfuscator for .Net Amazing Attributes:

Obfuscate and Harden your .NET Software against Attacks: The process of app hardening includes the program and the obfuscation and it has a layered approach that can be offered to the users.

RENAMING: The process of renaming of obfuscation give the name of some processes, factors, and makes source codes harder to comprehend and break. Dotfuscator uses a kind of obfuscation, which is improved by the PreEmptive solution and is developed for the Dotfiscator, it is commonly known as overload induction.   Apart from substituting a name just for every title, overload induction takes the process of renaming the names as many approaches as possible for the user. Following this step, the obfuscation which is profound, the logic, that is not ruined is way beyond understanding.

CONTROL FLOW: The procedure of the control flow synthesizes branching, conditioning as well as interactive constructs that are responsible for creating legitimate forwards as well as logic. However, sometimes the yielding of the non-deterministic semantic outcomes is the compilation and is tried.

STRING ENCRYPTION: The dotfuscator allows the user to conceal by searching for references of the chain right within the binary and the offender technique would be for the reason to find the segment of the code. Once the time expires, if the program is still on it may show a message, and if it's found by then try to look for the particular message which is within the compiled or the disassembled output translator the odds are that they will be near your very sensitive lock algorithm.

WATERMARKING: The process of watermarking helps to monitor the copies of the user application that helps to embed data just like copyright information, numbers of identification to some of the .NET programs. Here in this case the size of the user program does not increase. Watermarking allows the person to secure the content and does not allow others to copy from it.

PRUNING - UNUSED METHOD REMOVAL: Here the software is a small download and can be installed and run faster as well as load better. The Dotfuscator helps in removing those that make the program smaller and debugs the information and other non-essential metadata right in the MSIL.

LINKING - ASSEMBLY MERGING: Assembly linking may be used to build a program smaller, simplify the installation, and

particularly when it is utilized and it is the renaming and pruning.
