Codegear RAD Studio 2009 Enterprise

2024-12-18 23:02:00

With the help of Embarcadero Technologies, now the Codegear RAD Studio 2009 has been made available, and it is a very rapid development of the application tool for the purpose of building native windows. Such as the .NET and the database application that regardless of what the database, they still connect to or even embed. The Codegear RAD Studio 2009 has already combined the capabilities of the Delphi 2009 and the C++ Builder 2009 with nothing but the recent introduction of the .NET development and its capabilities of the Delphi Prism. The combination of these two provides the users and the developers with a new and complete environment that can support the low-level native windows as well as the higher-level managed development. The new refined RAD Studio, the edition of the Architect includes in it the Embarcadero ER Studio developer for the application of rapid development with the use of the database that is very powerful and is a modeling and has design capabilities. According to the Vice President of the Products of the Embarcadero, Michael Swindell, it has become very important to do everything faster, and with a better speed than what it was before and with the help of some few tools, the RAD Studio 2009 helps the users and the entire team to tackle the IT, departmental as well as the ISV programs that demand development. Today, this provides flexibility in order to reach the .NET on the Windows and then Linux along with Mac and the OS X through the Mono.

RAD Studio provides .NET developers with some features such as the following.

RAD Studio offers .NET programmers using the following key attributes:

- The Delphi prism which is already completely new is powered by the RemObjects Oxygen compilers.
- It allows the process of taking advantage of the greatest and the latest .NET technologies such as the WPF, ADO.NET, LINQ, and WinForms.
- The support of the deployment of the Mono platform that is available on Mac OS X and Linux.
- There is a great ability in developing database applications with the use of the dbExpress functionality and it allows the creation of .NET clients that are connecting to the DataSnap servers that are native.

RAD Studio empowers native Windows programmers to:

- The RAD Studio provides a very fast program for its users and enables them to manage the international data with the Unicode support that is new and gives them support for the IDE and the Visual Library components.
- It allows the process of the modernization of the user interfaces with the use of the new as well as improved VCL controls.
- It can handle the speeches that are modern in their features like in the case of the Delphi generics and the other anonymous methods in addition to the support of the historical C++0x which is criteria in the C++ Builder.
- It can create and construct a robust efficient as well as a secured database software by just dividing data logic of the business along with the new DataSnap.
- The user can now acquire fresh insights from the infrastructure of the database along with the information and modeling right at the version of the Architect.

The RAD Studio 2009 allows the users to create applications easily that can handle the global use of the data with the use of Unicode support. RAD Studio is very much available in the three editions RAD Studio Enterprise which is the software internet and the database and the constructive server or a client, RAD Professional for the construction of the application with just the database that is local and includes the robust management and design capabilities. Codegear is totally owned by the division of the Embarcadero and it was originally from the Borland corporation software and it was launched in the year 2006. Back in the year 2008 in August, Embarcadero Technologies had announced the release of the Delhi 2009 along with the C++ Builder. In the same year in the month of September, the Embarcadero introduced the new InterBase SMP 2009 to all its users. Again in the following month, the Codegear RAD Studio was introduced in the month of December.
