Strong visual ETL tool made especially for users with no technical background. Offers 100+ activities and 120+ works for simple data conversion, prep, profiling, and automation. Advanced workflows with loops and conditional branching. Auto-generated documentation. Free time-unlimited variant.

EasyMorph is self-explanatory data preparation and conversion tool which aids non-technical small business users to boost data investigation productivity by obtaining, merging, and manipulating information from several data sources. The remedy is beneficial for business users in sales, marketing, operational and financial evaluation, helping them change raw information collections to a technical evaluation in less time and with greater quality than working with spreadsheets. In addition, repetitive data-related tasks may also be automatic for greater efficacy.

EasyMorph includes over a hundred built-in transformations and shops all intermediate calculation results allowing users to click on any conversion measure and immediately see its outcome. Users may load information from databases, spreadsheets, and files and change it visually by employing various surgeries, such as a filter or combine, and export results for databases and files. The automated documentation attribute in EasyMorph empowers users to capture all data manipulations and calculations to ease earning changes, identifying issues, and keeping tabs on history.

EasyMorph's data conversion capabilities include data prep for dashboards and reports, more than 100 activities including merging, matching, filtering, aggregating, and much more, in addition to the ability to export and import from and to spreadsheets, databases, and even files of different formats. Users will also execute complex non-relational transformations like regexp, pivot/unpivot, or fuzzy matching and use information quality guards to prevent"filthy" or conflicting data from dispersing.

Automation attributes within EasyMorph enable users to substitute VBA macros or different scripts using visual workflows, program activities, and copy/delete/rename/unzip/download files. Users may also get and send emails with attachments, move documents over SFTP/SCP, run external applications, and implement batch and PowerShell commands. The solution also supports the capability to produce data-aware, rule-based alarms and organize conditional if/then/else workflows. EasyMorph provides support for databases hosted at Amazon, Azure, or Google.
