Bamboo Server is the choice of professional organizations such as continuous integration, installation, and shipping.

Continuous shipping, from code to installation.

Publish automatic builds, tests, and releases collectively in one workflow.

Construct: Concentrate on coding, rely on Bamboo as your own CI, and construct a host! Create multi-stage build strategies, set up triggers to begin building upon commits, and assign representatives to your crucial builds and deployments.

Evaluation: Testing is an integral part of constant integration. Run automatic tests from Bamboo to regress your goods thoroughly with every shift. Parallel automated evaluations unleash Agile Development's power and make grabbing bugs simpler and quicker.

Deploy: Bamboo provides exceptional support for its"delivery" facet of constant shipping. Deployment jobs automate the tedium out of discharging into every environment while allowing you to control the per-environment permissions stream.

Link: Bamboo boasts the best integration using Jira Software, Bitbucket, and Fisheye. Additionally, boost your CI pipeline by selecting from over fifty programs within our Marketplace or creating your own!

Granite helped to incorporate the general life-cycle activities associated with development, planning, and integration. A lot of online support is also accessible using a robust user community, making it very user-friendly. Help keep tabs on progress made in the program development life cycle.

Tech heap: Bamboo is acceptable for any language, along with other popular technologies such as AWS CodeDeploy, Docker, and Amazon S3. You can select from many available jobs for construction and installation projects or search for free add-ons!

Deployment jobs: Bamboo gives deployments the outstanding remedy with installation projects and surroundings. A setup project holds the job of the application you're deploying: released and tested and the surroundings to which sparks are deployed.

Dedicated agents: With Bamboo's dedicated brokers attribute, it is possible to conduct hotfixes, and crucial assembles immediately! When you devote a broker, no additional action will have the ability to use it unless it's devoted to this action too. This usually means no delay in the queue for free construct representatives whenever significant bugs are needed!

Visibility: Before deploying a new release, see the entire roll-up of code modifications and JIRA application problems due to the initial deployment. Ops teams may expect what they will be responsible for supporting and deploying in creation, and release managers receive a crystal clear perspective of what's going live.

Parallel evaluations: Bamboo supports around 100 remote construct representatives, providing you with the capacity to conduct heaps of tests in parallel, maintain the queue flowing, and also receive feedback from programmers quickly.

Docker representatives: aside from Docker jobs for construct plans and deployments, which enable you to produce your picture and drive it to a recorder, you will find all set to utilize Bamboo agent graphics on Docker Hub to catch and run.

Permissions: With per-environment permissions, programmers and QA can deploy their environments on-demand while manufacturing remains locked. Construct engineers and ops teams spend less time servicing setup asks, yet another bottleneck bites the dust.

Applications Tools

Quarantine: Do not let reddish builds become the standard. Maintain flakey or broken evaluations from sight (although not from the mind), also maintain the construct green using one-click quarantine.

Branch detection: Adopting the feature of a branch-per-issue workflow does not mean sacrificing code quality. Bamboo finds new branches in Git, Mercurial, and SVN Repos & uses the primary line's CI strategy to them mechanically.

Triggers: Bamboo can activate builds based on modifications found from the repository, push alarms out of Bitbucket, a set program, the conclusion of another construct, or some other combination thereof.
