Chaos Envision:

Chaos Envision is a cutting-edge creation tool developed for architects and architectural visualization professionals looking to take their Design to the next level with minimal effort. Envision goes beyond the normal boundaries established by CAD tools; it allows for the completion of complex and detailed scenes without worrying about performance compromises or quality loss. The assembly functions alone enable asset and scene integration from third-party 3D creation engines without loss of data or excess adjustments on a user's part.

Envision's real-time realism allows users to navigate through both simple and complex scenes in no time without sacrificing quality or fidelity. The creative flexibility is unmatched, allowing designers to alter any part of a project without having to pre-separate any object, which, in turn, contributes to a more natural flow of Design. It also supports cinematic storytelling, letting even first-time designers tell a constructed story about their intention in an interactive, emotional way that is easily and quickly deployable.

Animation support includes moving objects along defined paths as well as construction phasing, cinematics from above, and along designated pathways. Dynamism exists in a digital world with time-of-day control, wind, and animated trees, allowing for an immersive atmosphere. Through the Anima engine, crowds of animated humans can be added to designs to give life through movement and occupation.

Based on a sophisticated ray tracing engine, real-time rendering supports trillions of polygons for high-end visual realism. The Cosmos library offers thousands of render-ready assets with refined geometry and entourage that are ready to go upon drag-and-drop. AI supports improve vegetation elements and human character entourage, optimizing lighting, textures, and clarity. Design can be explored as users research what different materials look like across various lighting options; transitions between different states offer a reveal of new possibilities.

Unlimited variations mean that design options can be generated in minutes without excess resources being devoted. Realistic walkthroughs and visual presets, such as rounded corners and translucency, provide the natural look that users want when creating. Envision exists within the Chaos family of products and works seamlessly with Enscape or V-Ray; data can be transferred smoothly between products with minimal effort. Projects do not lose prior Design when utilizing a non-destructive workflow without restarting the visualization process; instead, during the design process, continual design updates will keep visualization projects accurately reflecting the state of the evolving detailed Design.
