

DIHtmlParser v8.3.0 (22 Nov 2023) for Delphi 11-12 Athens

2024-12-18 23:02:15

DIHtmlParser is described to be a part of the suite in order to parse, analyze as well as extracted information and also to create HTML, XML, as well as the files of the XHTML for the users of Delphi Embarcadero and even Borland. It is considered extremely fast, especially when parsing huge files for the users. It does not require loading the entire file into memory, but it can read a small chunk of turd a single time only. It can parse over 50,000 tags per second for the user, along with the outdated 166 processor of MHz. It only pursues what is required to parse, and even the parser eventually touches every character of the HTML document. It might only require storing a fraction of that data for future processing. This process is called intelligent parsing, and it is not storing unnecessary data for the user, it is a great way to save time and energy as well

as space. Another trick that belongs to the smart parsing process is the conversion of the relevant tag as well as the attributes drinks into an ordinal number ID.

can improve performance and reduce the load of the processor, and the user coding benefits from the technique as well. It is considered to be the next step for the customization of the HTML parsing. The plug-in's architecture can keep the overhead to a minimum, and it informs the person about the requirements ahead of the parsing process. The **DIHtmlParser** will never parse anything more than the user requirement.

Key Features of DIHtmlParser :

1. It can complete a Unicode support or even a Unicode string as well as a wide string, which is based on the version of the Delphi.
2. It can read as well as write over 70 personality sets as well as natively in an independent manner for the user and the developer.
3. It operates on the memory buffer, string, and even the TStreams.
4. It can return a single piece of HTML right into the program at a time.
5. It can extend easily with the help of the interface of TDIHtmlParserPlugin.
