

TatukGIS Developer Kernel for .NET v107.1.39243 (06 Nov 2025) ENTERPRISE

2025-11-10 10:27:23

The Tatuk GIS Developer Kernel for .NET is it correct to be a variant which is a controlled code and the .NET GIS SDK for the process of creating a professional software of GIS for the user Windows operating system. It is considered to be an entirely .NET CIL for the Win Forms as well as the framework of WPF is designed for the C# along with the VB.NET, VC++, oxygen, and finally with the harmonious development languages of the .NET. The developer of the Kernel has the ability to feature the same comprehensive object-oriented API for the user and developer that is basically an extensive functionality which is made for the geospatial program development process as well as other developer of the products of kernel. Except for the representing gaps as well as the various technology. The standard API along with the source code similarity right across the variation of the SDK has the ability to improve the portability between the platform growth as well as the operating system. All the supported formats of the layer are being represented with a detailed information about the support of operations of it along with the operating system as well as the required driver in the documentation Wiki of DK. It is considered to have no dependencies of the third-party software libraries and has an extensive API with roughly 750 classes as well as methods that are documented and properties. It is basically used in order to develop the custom application of the GIS order functionality to the existing product for the user and developer. In this case the source of the application code is similar across the platforms. The process of reflecting the format as well as an agnostic approach is capable of supporting more than 70 industry data which is geospatial and it is compiled into the software Library of DK. The formats are being supported natively without having to convert the data to any internal format of TatukGIS. A lot of other drivers are being supported through the external drivers.

TatukGIS Developer Kernel for .NET Great Features:

- The process of opening, creating, editing saving as well and exporting the vector, picture and the grid, including the format just like to database.
- Extension attribute, the arrow of the north, scale, other visual control as well are shown from the TatukGIS Editor/Viewer goods to the user developer.
- Attribute rendering as well as vigorous styling process which is based on the attributes as well as scale.
- Symbology prediction on the font, images, CGM as well as the built-in 700-plus symbols of the library SVG.
- It has a constructed line for design editor basically for the innovation line of the symbology which is user-defined line of fashion.
- It has the ability to provide an advance tagging process which include live positioning, following the line, overlapping the avoidance, as well as the multi field and formatting of the HTML.
- It has the ability to provide an extensive support for the open standard just like the services of GML, WFS, WMS, and finally WMTS.
- It is capable of printing just like the predefined printing template as well as the template editor.
- The enhance rendering of the GPU if it is supported by the system of operation.
- Vector as well as picture layer information as well as the procedure for the classification.
- The layer is capable of configuring all kinds of layers.
- The ramps of the color for almost all the coating.
- Dynamic aggregation of the contour in order to simplify the demonstration of the map.
- Tracking the layer service for a high rate of refreshing.
- Shipping the production, splitting as well as editing, merging hand snapping, and finally simplification.
- The querying of the attribute as well as the production and edition.
- Spatial querying which depends on the topological model.
- It is capable of providing a virtual picture failed that has the ability to update.
- Operation of the pipeline.
- It has the ability to support the 4K tracks whenever it is appropriate.
- The 3D rendering of the 2D as well as a midsize 2D contours along with the digital elevation of the design assistance

and the rendering in the 3D along with the item texturing.

- It has the ability to filter the morphological, dilation as well as threshold.
- The operation of the picture and grid along with the evaluation.
