Media Six LLC Blazor Studio v1.0.11 (22 Jun 2021)

2026-04-19 10:05:46

Blazor Studio is a powerful code generator for Visual Studio that produces no-code and low-code line-of-business back-office Blazor net software and RESTful microservices efficiently, saving days of time and effort for every job.

Blazor Studio is a powerful code generator for Visual Studio. Blazor Studio reads your database schema and generates *no-code* and *low-code* line-of-business/back office Blazor net software and RESTful microservices fast and easily - and - in just a couple of moments - saving hours and even days of time and energy. The Blazor Studio alternative template includes all of the job scaffolding to begin. The programmer also supplies an easy-to-use interface to configure the alternative data resources, models, and perspectives.

Solutions made with Blazor Studio use .NET Core with nicely organized and organized job scaffolding already made for you. The internet service is coordinated in an N-tier structure in different layers for data providers, operational providers, RESTful Web API endpoints, and their corresponding jobs and assemblies. The Blazor net application uses the API Versions and Customers as a connector into the Internet API endpoints. Another benefit to this design is the API Models assembly could be printed (through NuGet or alternative) and absorbed by other internet applications, incorporating your entire microservices into one program, if wanted.

Any new job takes hours upon hours and even days of composing simple scaffolding, database modeling, operational services, Internet API layers, and producing public versions for customers to eat. Programmers are costly - at least those that I know are. Begin all of your endeavors with Blazor Studio, along with your codebase, will probably be consistent, well organized, and easier to expand and maintain, resulting in a more efficient and more cost-effective development group. And whenever your schema changes, Blazor Studio may incorporate your changes by implementing simple refresh surgeries in the programmer, keeping your jobs up-to-date with minimal to no programming required.

Blazor Studio creates well-formed C# jobs. Our alternative scaffolding utilizes an N-Tier structure and is constructed using industry best practices.

Made for Blazor sites, we create code to the favorite Blazorise library and Bootstrap. And our alternative templates can easily be customized.

Produce Views and Models utilizing Blazor Studio designer, incorporated right into Visual Studio. Adding new pages is actually point-and-click/

Code is created from templates available and editable by you and your staff, letting you expand your projects even further.

Blazor Studio Great Features:

Blazor Studio is a Visual Studio Extension with templates that lets you easily stand up a new internet REST API and Blazor back-office web application in just a couple of minutes - saving you hours and days work for every job.

The websites created by Blazor Studio comprise the following attributes:

Site pages are totally responsive. Bring any apparatus to the celebration!

Websites operate on any modern browser. Most older browsers are also encouraged.

Our templates include the prevalent open-source Blazorise library.

Our templates are all based on the favorite bootstrap 4 libraries. Your programmers will feel in your home.

Alter templates to fit your requirements. Change design, safety, database, or anything.

所有软件资源 100%安全 已检测 无病毒 无篡改

.Net Components Other

New perspectives created all of the time - calendar views, profile page, blogs, etc...

- Blazor Web Application Option Template (.NET Core)
- Supports MS SQL 2019 database
- Creates Blazor Server program
- Authentication approaches via OpenID Link (OIDC) and also OAuth2
- Creates fully operational micro-services using RESTful endpoints along with API client libraries
- Injected page event handlers enable page activities like OnSave, OnCancel, OnDelete, OnCreate, and much more.
- Blazor Internet application is built with popular open-source projects:
  - .NET Core 3.1
  - Blazorise
  - Blazored
  - Bootstrap
  - FontAwesome
