Scalabium SMLogging Component Suite v1.70 for D10-D10.3 Rio

2026-10-09 16:08:12

SMLogging suite is a component set for logging in errors/exceptions, tracing of messages, events.

Scalabium SMLogging Component Suite Great Features:

Shed this part, and you will get the helpful processing of errors and exceptions for your application in 1 spot. Your user can automatically send you a bug report with screenshots in the attachment.
You can log some desired exceptions only with extended filters of exceptions.

It's possible to command your program in 1 location - message processing, hints, help, idle time, activation/deactivation, minimization/maximization, changing of selected control in any form, form changing, changing of windows settings, etc.

You can follow the job with a dataset - scrolling, state-changing, value editing, etc. Additionally, you may activate/deactivate logging into desired areas of your program.

You're able to follow the file/directory/drive changing - file creation, changing of size, attributes, or period.

TSMNTEventLog, you'll be able to control the standard log of NT occasions.

- Minor updates and bug fixes are free to registered users.
- Registered consumers are advised of updates and new software releases.
- Registered users may furnish the components in their source code.
