Altium Designer is described as a PCB as well as an electronic design automation software that is present for the users and developers of printed circuit boards. That was for an alien software company that could make Altium Limited. is basically a unified electronic design environment that is available for combining all the layout tools in an application of the software. It has a schematics capture, along with the design of PCB, and the program for the navigation, integrity of the signal analysis, the software application which is embedded and specializes in the application of the FPGA, the integration applications of the ECAD and MCAD, along with the library and the layout of the management of the data, and last but not least the generation of the output information, with the files of the CAM. The electronic design can attract the engineers who are employing a profoundly ingrained as well as an excitement for the creative process but the majority of the time is being invested outside the domain.

It should be noted that **Altium Designer** can empower 17 engineers in order to exude enthusiasm by modifying the attention to the creation of the design, evident from the active route and even the latest navigation technology available. The active route enables the designers and the users in order to interactively guide the courses right across the entire board within minutes. It allows the users to perfect the layout and think of an innovative solution to whatever comes up during the development process. It is coupled with the automated documentation of the technology in the draftsman as well as the designers who have the opportunity to bring the innovation to the forefront by conveying the design intent for the first time.

Along with the help of the **Altium Designer**, the engineers are no longer bound by the process that brings them away from the designing, which was burdensome, and it is considered to be in order to explore creativity and to create the additional designs that are inspired.

Key Features of **Altium Designer** :

1. It is considered to be a technology which is available worldwide and gives the designers the ability in order to work together from anywhere.
2. It has the ability to provide seamless integration across multiple platforms in order to create a design environment.
3. It collaborates with ease and watches as the user design comes to life, starting from the schematics to the 3D

rendering right from the BOM.
