

AppLife Server v1.3.0.6 (09 Oct 2018)

2025-03-03 10:48:45

AppLife Server is a smart platform to sponsor and distribute software updates made by AppLife Update. Compared to using a normal HTTP server for hosting AppLife upgrades, AppLife Server offers functionality enhancements, superior access control attributes, important analytical details regarding the status of program deployed customers. It supports the qualities of their AppLife Manager client program.

AppLife Server Great Features:

The AppLife Server dash is exhibited upon logon into the AppLife Server also enables a fast summary of all of the programs that the logged user is connected with, dependent on their assigned functions.

In their dash, applications can connect to the Application View for some of the programs by clicking the View icon. Drilling into a single Application View looks at the printed versions for that program, in addition to access to deployed customer information for this program.

In the Program View, users may view/edit individual updates by clicking on the view icon next to the respective edition.

Each the metadata about a single upgrade can be seen and altered from the Version view. Additionally, access control to the person upgrade can be seen and modified.

Back on the Program View, all of the individual client installations which are being preserved could be viewed, searched, and sorted. You can further research a single customer installation by clicking the information icon.

In the Client View, info about every individual upgrade the customer has installed is accessible. The current client version is readily identified, in addition to the outcomes of their formerly implemented upgrades. You may also search executed updates.

Programs are recorded on the home page of this AppLife Server user dash. The application's latest version and quantity of active customers are displayed in the dashboard. A publisher can get the specifics of a program by clicking the Edit icon inside the dashboard.

When editing a program, a writer can alter:

- Program Name
- Inform Owner of Failed Updated
- Empower AppLife Manager Integration
- Client Access
- Supervisor Settings

Be aware that You can't change a Program ID. Program ID could only be altered when developing a new Program.

AppLife Server offers access control to software and upgrades based on series token identification. The customer is identified through the auto-generated Client ID or the integrator designated Client Access Crucial. Access Control Lists can be made that include a listing of attributes that identify customers by Client ID or Client Access Crucial. These records can then be delegated to individual programs and upgrade variations.

AppLife Server ships with AppLife Manager, a Windows Service and Interactive System Tray interface which supports keeping Windows software with zero AppLife Update integration needed into the program source code. To utilize AppLife Manager, make an application and configure a brand new update endeavor.
