RAD Server v1.2 (06 Nov 2025) for Windows & Linux

2026-04-08 09:02:36

RAD Server is an effective back-end platform for developers with Delphi or C++Builder. It assists you in transforming your current code fast into contemporary RESTful APIs without having to create new code. You are either developing new web or mobile applications, or updating older systems; RAD Server provides you with a rapid, safe, and scalable means of managing services, users, and information.

RAD Server serves as the basis of your apps with such in-built functions as user authentication, push notifications, location tracking, and secure data storage. It is also compatible with connecting to enterprise databases and cloud environments such as AWS or Azure, and even to the devices of IoT smartness. You can go about user, API, and permission management through a basic web portal - no additional code is required.

It is designed to be simple for the developer. All you need to do is load your existing business logic, and the platform handles the creation and management of endpoints automatically. You are free to run your app on Windows or Linux servers or on the cloud. Besides, it is included with Enterprise and Architect versions of RAD Studio, Delphi, and C++Builder, so it is a brilliant choice both for a team and for software vendors.

Key Features of **RAD Server**:

1. **Auto-Generated REST APIs** – Instantly create REST/JSON endpoints from your Delphi or C++ methods.
2. **User & Group Access Control** – Manage API access with built-in role-based permissions.
3. **API Analytics** – Track API usage, performance, and user activity in real-time.
4. **Cross-Platform Client Support** – Compatible with desktop, mobile, and web applications.
5. **Enterprise Database Connectivity** – Connect to major databases using FireDAC (e.g., Oracle, SQL Server, MySQL).
6. **IoT Smart Device Integration** – Communicate with and control connected IoT devices.
7. **Cloud and Docker Support** – Easily deploy to AWS, Azure, or in Docker containers.
8. **Push Notifications** – Send real-time alerts and messages to users' devices.
9. **Secure Built-in Datastore** – Store data securely without needing external database systems.
10. **Location Tracking** – Monitor and respond to user locations or proximity events.
11. **Windows & Linux Deployment** – Host RAD Server on either Windows or Linux environments.
12. **Multi-Tenancy Support** – Serve multiple clients or tenants within a single deployment.
13. **Active Directory Integration** – Authenticate users through LDAP or Microsoft AD.
14. **Swagger/OpenAPI Docs** – Generate and share API documentation automatically.
15. **No-Code API Setup** – Set up fully functional APIs without writing server-side code.
