QueryAssist for MongoDB Great Features:

QueryAssist for MongoDB gives clever programming completion (IntelliSense) and automatic highlight errors for fields in documents and shell properties, functions, and methods. It can save you time and makes the writing process more efficient.

You can alter the values for any field in a document or type by double-clicking on any field in either tree or table views modes.

The QueryAssist application for MongoDB lets you automatically transform queries in Mongo or SQL to various languages of choice, including Java, C#, JavaScript (Node.js and shell), and Python.

It is possible to write SQL queries using both Shell and Collection views. You can toggle to Mongo or SQL query modes with a single click.

QueryAssist is fully compatible with MongoDB Enterprise - you can log in with either Kerberos or LDAP.

Export or import your data into MongoDB and JSON/CSV/SQL formats.

Organize your connections, databases, and collections using folders and colors, or add comments to any database objects.

Are you concerned about data you're afraid of losing? Make sure you set connections to databases, databases, or any other databases to read-only. Anything that requires modifications to your data via applications or shells is prevented.

Writing queries for Map-Reduce is now more straightforward using QueryAssist, the editor for Map-Reduce. QueryAssist includes the ability to code completion, error detection, and a data viewer for Map Reduce.

Download, upload, search and modify metadata on GridFS files.

Are you looking to transfer your collection to a different database or server? Copy the collections and then copy them wherever you require them.

The QueryAssist theme is for MongoDB supports themes. You can pick among five different color options.
