What is RichText?

RichText is a form of text that extends beyond plain text by incorporating formatting and styling information. Unlike plain text, which consists of basic characters without formatting, RichText allows the inclusion of features such as bold, italic, underline, diverse fonts, colors, and other text formatting options.

This type of text is widely employed in applications like word processors, text editors, messaging apps, and web development. It empowers users to craft visually appealing and organized content by applying various formatting styles to the text. Typically, the enhanced text representation is stored in a format that encompasses both the actual text content and the associated formatting instructions.

In the realm of programming and web development, handling RichText involves utilizing markup languages like HTML or employing specific libraries and frameworks that offer tools for manipulating and displaying formatted text.
