Fast Pipes within Blender is a basic class and it is not necessary to have prior knowledge of Blender to learn the classes. This course is one that advanced users might find useful since it reduces the time required for creating pipelines, or other similar models.

This course will help you discover how to quickly design and multiply pipes to create long pipelines with minimal effort, and then bend and deform these pipes around the curves as necessary. After this class, you will have gained experience modeling pipes, creating pipelines, and utilizing various modifiers to facilitate the process.

The lessons you will learn in this class could be applied to the design of pipelines, but to any design in which you have to extend objects or bend them in order to allow them to shrink or grow on certain timelines, This is extremely useful to create animations, too.
