CrystalNet ADO.Net VCL for Delphi XE-10.4 Sydney v4.0.5.0

2026-09-08 01:11:26

The ADO.Net DAC for Delphi has been described to be the fastest and the most reliable connectivity of the database along with the alternatives for the virtual as well as the database with the use of the technology of the ADO.NET in the Delphi. It has the ability to offer the users and the developers with the data access to the source of the information dislike the SQL Server, Oracle, Vista DB, SQLite along with the source of the information which is exposed through the OLE DB, ODBCwith the data provider frame of the ADO.Net. The ADO.Net DAC for Delphi is known to be an Enterprise solution that has maximum functionality and possibilities that are infinite. The user application of the data sharing can be used by the ADO.Net DAC for the Delphi in order to link to the data sources as well as retrieve, manage, and also upgrade the information that it contains. With a strong architecture Foundation that it has on the ADO.Net technology, it provides the user with a high speed of direct information access from the Delphi into the server of the SQL, Oracle, and the information sources that are exposed via the OLE DB and the ODBC. The ADO.Net DAC supplies a library that consists of components for the process of connecting to the database, as well as executing the commands and finally retrieving the results. The outcomes that are opened are processed straight and the elements are position in the virtual table.

It has the following features and attributes such as:

- It provides direct access to the data server without any need for the library of the client.
- The installation of the data provider layers is not required by the users.
- It has the ability to provide a method in order to sort the records that have been collected.
- It has the ability to support the process of posting updates that are deferred and are called cashed updates.
- It has the power to provide methods in order to filter the records and the process of database filtering permits the user in order to get the recorded subset which is based on a certain condition.
- The user and developers are provided with flexible support for the relationship of the master-detail between the data sets.
- It is very easy to use and deploy.
- It has unique support for Unicode.
- Copying of the data in bulks is permitted by the user and the developer with the use of the component such as TSqlClientBulkCopy.
