

Devart dbForge Source Control for SQL Server v2.7.2 (12 April 2024)

2024-12-28 23:38:43

is an indispensable SSMS add-in, designed for easy tracking and deploying changes within SQL Server databases. Seamlessly linking your SQL database to a Version Control System, this tool facilitates efficient database change management across all popular version control systems and servers. It can be integrated into the database DevOps pipeline to automate SQL change management, providing a robust solution for both dedicated and shared development models.

With **Devart dbForge Source Control for SQL Server**, you can version-control database schemas and static table data, commit and revert changes with dependency awareness, and effortlessly view and resolve conflicts. The tool enables you to track changes and detect who, when, and why made them, enhancing transparency and accountability. Integrated directly into SQL Server Management Studio, it automates database development with a DevOps approach, ensuring the overall integrity of your databases throughout the development process.

Supporting all major version control systems, including Azure DevOps Server, Apache Subversion, Git (including GitHub, GitLab, and Bitbucket), Mercurial, Perforce, and SourceGear Vault, dbForge Source Control provides a comprehensive solution. Whether you need to version-control database schemas and data, view and resolve conflicts, or roll back changes, **Devart dbForge Source Control for SQL Server** ensures that you can deploy your databases safely without losing data, making it an indispensable asset for database development and maintenance.

Key Features of Devart dbForge Source Control for SQL Server :

1. Version-control database schemas and static table data
2. Support for both dedicated and shared development models
3. Commit and revert changes with dependency awareness
4. Visual conflict resolution for data and schema inconsistencies
5. Track changes and detect who, when, and why made them
