### Convert into One Styles One Styles

Since Adobe Lightroom and Capture One are two completely separate RAW converters, they are a few technical obstacles to the process of conversion. Certain Lightroom functions cannot be replicated exactly with Capture One, because there isn't always an equivalent function available in Capture One. In these instances the values are transferred to another function that is based on optical standards, leading to similar results in the majority of instances. But, as every image is exposed in a different way and a preset is typically only a starting point to further image processing, tiny differences are often irrelevant. If the result of your image differs in any way because of the conversion, you are able to adjust the settings quickly. The main cause of the error is gone if all white-balance settings are removed out of the set. In any event, this is simpler and quicker than manually recreating the entire preset and also gives you more time to adjust the appearance of the image you are using.

### Advantages:

- The choice is vast of Lightroom presets available with Capture One.
- The presets that users create can be easily transferred to another device and used later in Capture One.
- A wide range of presets may be transformed (batch convert).
- There's no need for a long and tedious exercise, particularly for curves.
- Converter to .xmp as well as .lrtemplate presets.
- The creation of individual styles (.costyle) as well as Stylepacks (.costylepack).
