

SQL DXP Premium v6.6.1.183 (21 Apr 2022)

2025-01-21 01:31:52

Cross-Platform can compare and even sync the schema and the data for the servers of SQL, Oracle, and even MySQL.

Cross-Platform Evaluate

The SQL DXP can compare databases and hence the SQL Server to the SQL that the SQL delta forms can be contrasted.

Project Manager

Tabbed Projects

The more the user runs two jobs while it is just about to schemas that are comparing the job on the schema or even the server can compare the information and the endeavor was on the precisely of the server. Since each and every method can be run in threads while waiting for the comparing procedure to finish. The user will able to review the process of conducting an upgraded script.

Group Projects

The user can assign each job to a group of jobs. The user can even put off the information and compared the jobs. He can put a server group of posts under groups that are single.

Schema Compare

Directly Forward Compare

The process of comparing two databases is fast and effortless. In the new project the user through the source of the database and click on the target database. The delta of the SQL will show a synopsis of the object that is not in the origin or even the target. It is very possible to see the schema level and the differences by choosing each item respectively.

Comprehensive Project Options

Each schema in this case can compare jobs as a selection of jobs to decrease the differences in the discovery. For instance, the objects have a limitation with the system title and there is a difference between target and the source and hence they can be dismissed.

Comprehensive Search and Filtering

In this case, the items can be filtered based on the variety and the alternatives. In this case, conceal is a regular filter. Some filters can be persisted for the user to run the job and this persistence can be used to pre-deselect or preselect certain items that are handy when the user has it.

Filter Schema Load

The user may use a filter in order to exclude items. For instance, then you can have a pair of functions. This will allow the user to be able to eliminate the purposes by the process of incorporating the load filter.

Data Compare

How does it operate

The process of data comparing is usually utilizing the primary key as well as one or more indicators of the columns. In order to decide whether a row in its origin can fit a row in the table or not. The information which is obtained can compare the scan of every column as soon as a match is found.

Comprehensive Configuration

Data direction is very important as it is the right to choose the target and the source of the database, also to run on the quote. The delta of SQL performs the contract and it also decides the tables that are having primary keys as well as column titles.

Table and Column Mapping

The table is at the source of the database and has a different name. The origin of the name of the table can be mapped by the data compare process. Where the origin column can be mapped into a column of the target, the same thing applies to the columns. In this case, the data correspond is taking good care of their title varies.

Data Filtering

The table of the data can be filtered in order to exclude the rows during the filters and it utilizes regular as well as load in the format of the clause.

Data Compare Perspectives

As a part of the information of the data compare perspective they compare the views and it can be included. A source of perspective may be used in a table to target a very good way of supplying populating a table of goals.

Export Data Compare Scripts

In this case, the information is being compared and that can be massive and can even be stored to files through planned procedures. Data are compared so that the user can see the set-up of the scripts and the script screen will be able to show codes in the form of a line.
