NoSQLBooster for MongoDB v7.1.17 (21 Dec 2022) for Win & macOS & Linux

2025-02-13 22:51:37

The NoSQLBooster for the MongoDB is described to be a shell centric cross-platform for the tools of the GUI for the MongoDB, which is capable of providing the users. The developers are a comprehensive server monitoring tool that is very fluent and has a builder of the query, SQL query, code query, the new feature, which is the task scheduling, and finally, the experience of IntelliSense.

With this help, the user can run the SQL select query as the SQL has the support, which includes the SQL JOIN functions, expressions, and aggregation for the objects that are collected and nested along with arrays.

It can support the API builder, which is the fluent query to permit the user to create a query using the syntax, which is chaining instead of the specifying object of the JSON.

The free edition of vacancies is a free personal commercial for all users and developers to use with limited functions.

After the 30th day, the product is a free edition. Whenever the user decides to choose the code generator of the SQL, it is essential to keep in mind and consider the speed at which the user can carry the queries of the SQL out.

The user can be assured that the MySQL query builder tool we provide is more advanced than the others available in the market.

The tool that we provide has been able to optimize as well as carry out the query complex in a faster as well flexible manner. It can combine with the innovation as well as the user-friendly drag-and-drop interface that allows the user as well as anyone in the organization to have the ability to gain the same result as the others.

Connecting to MySQL, PostgreSQL, MS SQL, and even the Oracle database to data pine has been taking less than 10 minutes. The user can run the complex queries of the SQL using the data analysis tools within minutes.

The process of drag and drop has simplified and helped the user to drag the data that he desires, and he will measure right into the place whenever he wishes to measure them. The NoSQL Booster visual explain plan can transfer the output to be explained right into the view of the hierarchy of the plan of the query.

It is significantly more accessible for the user and developer to read and understand and allows the user to tune the query for enhancing the query and resolving the performance and the issues.

It is a particular tool that can parse the logs quickly and generate the output information about every content, including a timestamp, severity, context, and last but not least, the command-specific messages for the users and developers.

The NoSQL Booster can embed the V8 JavaScript engine and the point that no MongoDB command line can gear that outside the addiction.

It can convert MongoDB to find and aggregate and, simultaneously, the SQL to Node.js, Java, Python, and even the C#, PHP, Ruby, and last but not least, the Goland along with the shell formats of the Mongo.

It can establish and for the process of importing and exporting, dumping and restoring, and at the same time, running the script documents onto the recurring program. It consists of tools for the process of performance monitoring. It can form the SQL Server and MySQands for the users and developers and export documents to the file format of XML, CSV, JSON, XLSX, and so on.
