What is the Double Exposure Photoshop Effect

The Double Exposure Photoshop Effect is a creative and artistic technique in which two or more images are combined or overlaid to create a single, composite image. This effect is often used in photography and graphic design to produce visually striking and surreal compositions. It gets its name from the traditional photographic technique of exposing the same film or photographic paper to multiple images, resulting in a double exposure.

In the context of digital image editing using Adobe Photoshop or similar software, the Double Exposure Effect is achieved by blending and masking multiple images together.
