RAD Server Installer for Windows and Linux v1.2 (03 Nov 2023) Retail

2025-01-10 21:27:24

I've shown the complete, ready-for-business solutions created using RAD Server. For example, the Field Services Industry template contains REST endpoints, which the Field Service Administrator and the Field Service Application are connected to. It makes use of InterBase on its backend for database storage.

Or the Hospitality Industry template that includes an application for mobile devices to collect survey data and a backend server to manage surveys and store data, and a web client for viewing survey information. It also includes RAD Server with multi-tenancy capabilities.

Embarcadero Technologies provides ready-to-use installers for deploying RAD Server on Linux and Windows servers to deploy your solutions quickly.

RAD Server is easy to create, deploy, manage, and maintain the system that is easy to deploy, develop and operate for ISVs and OEMs building REST API endpoints. It offers many unique features like multi-tiered development, cloud or on-premise deployments, and built-in services such as user management push notifications, location tracking, and integrated data storage. RAD Server can be deployed in production using either Windows or Linux. For Windows, RAD Server can be run on IIS using an ISAPI-based library.

You can configure IIS manually by following the steps on the DocWiki under installing IIS manually. You can also install the RAD Server and use the RAD Server Console in a production environment for Windows or utilize the Delphi console application and the Powershell script to compress the required files and then automatically create a new site and application explicitly designed to work with RAD Server. Before configuring IIS, you need to set up a RAD Server Database (powered by InterBase).

RAD Server Installer for Windows and Linux Great Features:

- Installing InterBase on Windows
- Packaging Up the Required Files
- Creating New RAD Server Website Directories For IIS
- Configuring IIS For RAD Server With Windows PowerShell
- Deploying Custom Resource Modules
