Tools   Applications

Network Monitor allows you to monitor, record, and analyze data packets that devices, applications, and computers exchange through networks. The program can be helpful in the development, debugging, and analysis of hardware and software solutions that make use of Local Area Network (LAN) Intranet or Internet communications. The network protocol analyzer will provide users with a complete set of tools that allow for advanced decoding of networks protocols and analyzing data packets in both offline and online modes. The different editions offer a view, browse, search, record, filter, and playback data.

This software for monitoring networks provides users with various visualization tools to support all network protocols that are popular along with raw data. Additionally, it has tools to create custom visualizers that allow you to analyze I/O data according to your custom protocols and their definitions. Alongside visualization, our software allows you to export data, save recorded data into log files, playback earlier recorded information on the screen, create custom packets, send them to ports by the rules you specify, and automate workflows using built-in scripting. By using custom visualizers, analysis of protocols, and scripting, you'll be capable of handling certain situations. It's a complete software sniffing, analyzing, and data logging tool that requires additional hardware.

Our software for network data capture was developed and continuously developed over the last 15 years. It comes with a simple user interface, extensive documentation, and examples. It does not require any special programming knowledge to use it. Download the network analyzer today and begin tracing the network's packets in just a few minutes!

HHD Software Network Monitor UltimateGreat Features:

- Our software for analyzing network protocols can capture the entire network traffic that flows that is sent between the computer you are using and the remote host at extremely high data transfer speeds, where competitors' software cannot do so. It offers a broad range of data-sniffing high-performance capabilities for each networking adapter or the interface.

  The actions of each network adapter could be tracked in real-time. Highly efficient and meticulously optimized algorithms for processing data are not a hindrance to monitored communication. This is what makes our product the only non-intrusive software for analyzing network protocols in the marketplace in the present.

- Our network analyzer comes with sophisticated protocol-based filtering features, which lets you design and set up filters for network packets and then quickly apply them to display windows and even modules for exporting data. The filters are specifically designed to provide high performance and filter on the fly without impacting the monitored communications.

  Furthermore, you can alter the visual appearance monitored in data visualizers, including Structure View, Raw Data View, HTTP View, and Custom View. The only other product lets you alter your output as quickly and efficiently as our software.

- This is the sole one among other applications for monitoring traffic on networks that give you the possibility to not only monitor the TCP/IP and UDP communications in real-time and record the network information in the log file . This gives you the ability to replay and study it in the future and share with colleagues.

  Our network monitoring tools can allow you to duplicate any fragments of data previously recorded on the screen and export it in binary raw and text.

- Basic capabilities of tracer for network packets include viewing and navigating the monitored data. All visualizers permit a particular pattern of data to be quickly identified by using the search feature's powerful capabilities. The search can be quick in the entire visualizer window or only specified areas.

Certain visualizers also offer advanced search capabilities, such as searching for text using various encoders, binary data, or even searching using regular expressions.

- Our software lets you decode network packets and get the most accurate information, using customizable output capabilities that are flexible. It allows you to explore and display the text or binary data of every packet monitored with all character encodings used by the Windows platform.

  You can arrange your data into groups, assign your structure or color scheme, and specify rules for highlighting specific data sequences, using regular expressions, and more.

- Our tools for analysis of traffic offer the user the ability to analyze statistical and graphically data gathered from monitoring of the TCP/IP and UDP connections. It is possible to analyze not just the data in real-time but also past data stored in pre-recorded log files.

  The below data parameters that include: Packets total/sec, Bytes Total/sec read/sec, bytes written/sec IO Packets/sec. The program lets you modify the data that will be analyzed and determine the type and format that the data analysis will take.
