KDTele Tools is a project to create simple-to-use, flexible and powerful collection components for telephony applications development. You can choose from a Basic Module or a variety of Add-On modules. The Basic Module contains essential components to telephony, while the Add On Modules provide additional capabilities.

### Data Add-On

Create computer-to-computer file exchange and data applications. Support ZModem file transfers protocol and file compression/encryption.

### Fax Add-On

Include fax capabilities in your application.

### Multi-Calls add-on

Multiple telephone lines can be accessed simultaneously

### Speech add-On

Your application can now include voice recognition and voice synthesis.

### Wave Editor Add-On

Your application and your end-users can view/edit sound files.

KDTele Tools allows programmers to add powerful features such as voice recognition, image editing, file compression/encryption, and wave sound editor to their software.

## KDTele Tools: Great Features

- Answer incoming calls and make outgoing calls.
