O2 Solutions PDF4NET is a powerful and easy-to-use .NET library, enabling developers to create, edit, and manage PDF files within their applications. It is fully written in C#, so it is actually a.NET component, not a wrapper, and can be released royalty-free. Its simple and transparent design allows even complicated tasks with PDF to be performed with only a few lines of code.

The library assists in the creation of new PDF documents or in editing the existing ones. Developers can create well-organized layouts, support right-to-left languages and multifaceted scripts, complete and lock PDF forms, and add digital signatures that meet current security requirements. It is also simple to combine, divide, convert, or stamp PDF documents with PDF4NET and still have complete control of the page contents.

O2 Solutions PDF4NET is compatible with many platforms and versions of .Net thus can be used in desktop, mobile, and cross-platform applications. Addon programs enable developers to view PDFs within Windows programs or convert PDF pages to images. All in all, PDF4NET is intended to be stable, expandable, and easy to code, whether it's a small utility or a large-scale solution.
