

Altium NEXUS v5.8.2 build 18 & Server v1.1.4.125

2024-12-18 23:02:15

Altium NEXUS is a simple to execute, team-based PCB workflow option designed to supply the transparency required for engineering teams to collaborate with confidence. Though Altium NEXUS includes each of the various industry top PCB domain editors necessary to make a circuit board, its heart DNA allows design teams to work together.

Altium NEXUS is an exceptional solution for bigger firms that functions as a hub for your total PCB design process using complete eCAD/mCAD and PLM integration. Altium NEXUS joins whole groups, from PCB designers and mechanical engineers to Project Managers and Master Librarians, engaging everybody in the plan and launch procedure.

Design cooperation is empowered through user functions and handled data (library and layout) while supplying process automation and a frame to configure shared electronic design tasks and workflows. This gives organizational transparency to style information changes and workflow conditions through function-based notification. Using Altium NEXUS, firms will be able to handle their own PCB data, enhance communication as it pertains to multidisciplinary technology, and then configure and automate workflows replacing existing manual processes - causing the decrease in design respins and delivery of high-quality goods in a shorter time period.

Altium NEXUS 1.0 introduces new technologies in PCB information management, design collaboration, workflow, and process management, making it the most extensive circuit board design alternative while taking the risk from integration and installation.

Altium NEXUS comprises server technology to encourage collaboration, process management, and information management, hosted on-premise (like Altium Vault), or cloud (option not available previously) environments. The center design and PCB layout technologies of Altium NEXUS are equal to that of AD18, sharing 100 percent of their layout capacities - today and always.

Therefore, AD18 (and outside) will **no more connect to an on-premise Altium Vault**. Clients and users of this Vault can change to Altium NEXUS and join seamlessly to their present Vault with complete data integrity and capacity preservation. There's no extra charge to clients on active maintenance subscriptions; as mentioned previously, the schematic and PCB capabilities and user interface of Altium NEXUS and AD18 are indistinguishable.

As a standalone solution, Altium Vault 3.0 will likely be our final launch with new capacities. However the Vault technology will continue to evolve and progress as a core component of Altium NEXUS. Altium NEXUS will provide a host of its own in the not too distant future, which will expose new capacities for collaboration, information management, and process management. These new skills have been made possible through the integration and continuing development of technology from Vault, in addition to current Altium acquisitions of Ciiva, Perception Software, and much more.

A different design option in its own right, the *Altium NEXUS Server* functions in harmony with Altium NEXUS to supply an elegant response to the question of managing design information with ensured integrity. The Altium NEXUS Server, not simply supplies rock-solid, protected storage of information, but also empowers re-release of information as clearly different Upgrades - basically monitoring design changes with time, without overwriting any previously published info. It caters to the lifecycle of their information to be handled, allowing individuals who will need to utilize the information to view, at-a-glance, what point the information has attained in its lifetime' and consequently what it could be safely employed for.

However, the Altium NEXUS Server can be used to save much more than only the data created from a plank layout. It's also utilized to handle the rest of the sets of information accessed from the Design Area via certain discharge procedures, including the launch of part definitions, domain models, schematic sheets of circuitry and layout templates. Really, you may also create and manage your whole design jobs directly inside the machine, together with the further advantage of cooperation support, meaning that an whole team can operate simultaneously on precisely the same plank design - annotating the layout together with remarks. You can control your own artists' working surroundings - making sure that

company-wide design criteria are enforced and adhered to.

By providing a pair of reusable design'building blocks' inside the Altium NEXUS Server, you can embark on new projects safe knowing that every version, element, and higher-order design component was ratified accepted for use, without needing to reinvent the wheel as it had been. The host becomes both the destination and source of layout components, with every new layout using elements introduced to, and handled via, the host. And by designing just using components from the Altium NEXUS Server, these designs' ethics is inherently ensured.

The NEXUS design cooperation panel frees social interaction involving designers to keep team members in sync. Schematic, Design, MCAD, and PCB multi-board interactions involving staff members are done utilizing the cooperation board, and listed as a member of the plan history. This enhances cooperation and provides a list of why, when, and from whom layout choices were made.

NEXUS Procedure Manager provides a group of pre-defined templates for common workflows such as Job Initiation, Part Request, and Design Review. These procedures may be utilized responsibly, or easily altered to match your distinctive workflow utilizing the visual procedure editor. New workflows can also be constructed from scratch using a simple "drag & drop" approach.

NEXUS contains a configurable component library using conventional content. Easily import or add your own parts, footprints, logos, and models to construct shared libraries which may be shared across a workgroup, staff, or whole company with consumer and role based access management.

NEXUS strikes the ideal balance of control and creativity for projects and organizations involving numerous individuals. A configurable design launch method is constructed into NEXUS, promising suitable reviews, characteristics, and layout checks completed before PCB designs are introduced into the company's remainder.
