

Callback Technologies CBFS Sync 2024 v24.0.8974 Delphi Edition

2025-04-11 15:46:47

is a powerful cross-platform library that simplifies the synchronization of local files with cloud storage or remote repositories. It provides developers with an easy way to implement two-way synchronization, similar to services like Microsoft OneDrive. With its event-driven API, CBFS Sync allows real-time monitoring of local files and folders, making integration with cloud services and file storage solutions seamless.

The library delivers a native experience by using the operating system's own icons and indicators, ensuring smooth functionality across platforms. It offers a unified API that supports Windows, Linux, and macOS, relying on industry-standard technologies such as Cloud Filter API, FUSE, and File Provider. This consistent interface makes it easy for developers to create cross-platform applications while maintaining high performance.

Available in multiple programming languages, including .NET, Java, C++, Rust, and Go, CBFS Sync is built with flexibility in mind. It supports asynchronous operations, allowing for more efficient and scalable synchronization. With ongoing development for mobile platforms like iOS and Android, **Callback Technologies CBFS Sync** is designed to meet the needs of modern applications across a wide range of environments.

Key Features of Callback Technologies CBFS Sync :

1. Real-Time Local Folder Monitoring: Automatically detects changes in local folders and initiates synchronization, providing real-time updates.
2. Asynchronous Operations: The asynchronous nature of the API improves performance and simplifies complex synchronization tasks.
3. Cross-Platform Compatibility: Currently available on Windows (Intel and ARM), Linux, and macOS, with mobile platform support (iOS and Android) coming soon.
4. Unified API: A single, easy-to-use API wraps around Cloud Filter API, FUSE, and File Provider, streamlining
