ZZZ Projects Bulk Operations (Z.BulkOperations) v6.1.0 (09 Dec 2025)

2026-01-09 10:47:53

is a powerful tool that helps you perform high-performance database tasks like inserting, updating, deleting, and merging data in bulk. It extends the capabilities of SQLBulkCopy, offering advanced features that make working with large datasets faster and more flexible. Whether you need to insert new data, update existing records, or delete entries, Bulk Operations makes these tasks more efficient while overcoming the limitations of SQLBulkCopy.

One of the key advantages of **ZZZ Projects Bulk Operations** is its ability to output identity and concurrency values during inserts. This feature makes it easy to handle scenarios requiring the system to return generated IDs for newly inserted records. Bulk Operations also works with Generic List<> and allows the use of lambda expressions for better code readability and maintenance, ensuring that your code is more intuitive and easy to manage.

Additionally, **ZZZ Projects Bulk Operations** allows you to perform bulk actions directly from LINQ queries without loading data into memory. It also provides flexible configuration options for handling case sensitivity and offers logging and auditing features to keep track of operations. This makes Bulk Operations an ideal solution for developers working with large datasets who want to optimize performance and simplify their workflow.

Key Features of **ZZZ Projects Bulk Operations** :

1. BulkInsert, BulkUpdate, BulkDelete, BulkMerge: These functions perform high-performance database operations like inserting, updating, deleting, and merging large datasets quickly.
2. Output Identity and Concurrency Values: Retrieve identity values and handle concurrency columns during inserts, making it easy to work with generated IDs.
3. Support for Generic List<> and ExpandoObject: Use strongly typed lists or dynamic objects as data sources, improving code readability and maintainability.

.Net Components Other

4. Lambda Expression Mapping: Map database columns using lambda expressions instead of hardcoded strings, simplifying the code.
5. Bulk Operations from LINQ Queries: You can perform bulk delete and update operations directly from LINQ queries without loading the data into memory.
6. Case Insensitivity and Custom Configuration: Auto-map columns with case-insensitive matching and configure options like batch size, logging, and auditing for greater flexibility.
