

PureComponents .NET WinForms Suite v2011.1 Full Source

2026-09-25 10:26:08

PureComponents .NET WinForms Suite is a complete set of high-end components available in the .NET WinForms marketplace with over 80 unique controls, including LightGrid, RichCalendar GridCalendar, RibbonUI, TreeView, VisualExtender, and more.

ActionSet.Navigators with Access and Outlook-style navigators, you can enjoy an easy way to navigate your applications.

ActionSet.RibbonUI Complete set of components that build a user interface using Microsoft Office 2007 style.

EntrySet.Controls - Interface components for users to create data entry forms with a professional design and appearance.

EntrySet.Lists - Set of data-bound list components to access and display data using various views.

EntrySet.Extenders Components that extend controls by providing visually appealing features and validation functions and the ability to bind items.

ScheduleSet.Calendars - Set of components designed to show and manipulate date-based data and information.

PureComponents .NET WinForms SuiteGreat Features:

LightGrid is the better option for DataGridView

Utilizing PureComponents' PureComponents LightGrid control, you can edit and display tabular data coming from various types of sources. Its LightGrid Control is exceptionally customizable and expandable and offers a variety of properties methods, events, and methods to alter its appearance and behavior. It allows styles for all its parts, which include rows, columns, and cells. LightGrid cells can be filled with markers, images, flags, and a progress bar. Cells are formatted and can be modified to accommodate various data types, including a date picker for dates and checkboxes for variables that are boolean. The component can be sorted and filtering too.

TreeView Control

TreeView is built on the object model of the standard TreeView component. It is enriched by various valuable functions that make it a significant component to display information in the hierarchy. With the help of the in-place designer, you can build an information tree without writing a single line code. In run-time, it is possible to edit every node of the hierarchy and modify their location by dragging and dropping. You can highlight certain kinds of information in a variety of methods. You can accomplish this by using flags, underline, or Flash function. Each node also has its image.

Months designed

GridCalendar lets you display the individual months in different designs by using MonthRanges and MonthRangeStyle definitions. Each MonthRange is comprised of StartYear/StartMonth and EndYear/EndMonth. If the definition for Year is not filled in and the range is then applied to all years. MonthRangeStyle definition lets you set the background of the month, row Header style, and a day-shaped.

MultiList Expanded ListBox Control

This PureComponents MultiList control is an extension of the ListBox control by adding some useful features. It can display the description text, as well as the checkbox for every item. Each item could also have an image. It can also be identified with a simple symbol like an eagle. The bar with flags may be placed on either the left or right-hand edge of MultiList. On the uppermost part of the control, the specific item is available as the Action Item.
