

Atlassian Crowd Enterprise v3.3.3 Multi OS

2025-02-27 19:30:44

Crowd Information Center is Atlassian's centralized identity management system. It's possible to manage users from several directories (Microsoft Active Directory, Lightweight Directory Access Protocol [LDAP], OpenLDAP, or Microsoft Azure Active Directory) and command program authentication permissions one site. The crowd is a self-managed solution that provides you high availability, performance at scale, and disaster recovery for uninterrupted access to your own resources.

Handle users from several directories - Active Directory, LDAP, OpenLDAP, or Microsoft Azure AD - and - control program authentication permissions in a single site.

Single sign-on (SSO): Make life simple for the users by providing them one password and username to log into each of the programs they want access to. Seamlessly incorporate all of your Atlassian goods - such as Jira, Confluence, and Bitbucket- to present your customers with one easy single sign-on (SSO) experience.

Centralize numerous directories: Map any combo of directories into one application -- ideal for handling users, not in your primary directory - and handle authentication permissions at precisely the same location. Get started with connectors such as AD, LDAP, Microsoft Azure AD, Novell eDirectory, and much more. You may also make your own custom connector.

Crowd Information Center integrates with your current infrastructure and provides you with uninterrupted access to the resources you will need - even in a hardware failure.

Active-active clustering: Provide your customers with easy accessibility to Crowd and the other systems attached to it using its active-active clustering version.

Directory failover: Define multiple failover directories to decrease your group's login experience as soon as an external directory fails.

Autoscale prepared: Remove or add a node to decrease effect due to raised authentication load.

Microsoft Azure Active Directory service: As VPC options become more popular, join your Microsoft Azure Active Directory into Crowd.

Integration extensibility: Utilize 3rd party add-ons using Crowd to incorporate with your customized infrastructure.
