Webix is described to be a Javascript, HTML5 as well as the tool kit of the UI the process of developing complex and dynamic cross-platform applications for the users and developers. The framework is considered to be developed by the outsourcing company of the IT as well as the software of XB, and it is headquartered in Belarus. It consists of the controls of GUI, widget, and the complex widget and the online tools such as snipped tools, form builder as well as skin builder. All the widgets are capable of supporting the process of drag and drop, along with offline storage and synchronization and the paging of dynamic data. They can initialize from the data of JSON, HTML, XML, or even the JavaScript call. It consists of the control of the GUI complex project as well as the online tools and can integrate the libraries that are client-side with the framework like the react, Angular as well as Vue. The Webix standard is known to be a free as well as an open-source which is under the license of the GUI GPL V3 and it can be used for the application which is distributed under the MIT, BSD as well as other open-source licenses with the exception of the FLOSS. The Webix widget components are capable of building from the smaller component of the webix library. It is mainly a layout process that consists of the speedy evolution of the interfaces of the web. Webix JavaScript has a frame that relies on the fundamentals of the programming and it includes a JavaScript library that is huge. Its layout system enables the users and developers for the process of placing an attempt or even getting the design from the box. It has over 100 net widgets which are capable of offering for the library in addition to the programmer as well as the five main layout skins. The Webix is described to be versatile and has an incredibly JavaScript frame of UI with the vision of HTML5 for the process of creating a cross-platform of HTML5 and CSS3 which is compatible internet as well as the mobile program. It is a very perfect tool all for the process of building robust as well as rich programs for the users that can function on all the platforms. The library is made up of a 99% flexible UI widget as well as CSS and HTML 5 along with JavaScript which is a feature-rich controller. It is also described to be a JavaScript HTML5 as well as the CSS3 UI tool kit for the creation of dynamic as well as complex cross-platform internet software. The Webix UI can provide libraries that are capable of providing a huge number of widgets that are capable of meeting the complicated request of JavaScript as well as the development and support of the latest browsers. These UI components can be easily integrated into the existing app and all thanks to the customizable and adaptable features that they have. It permits the user on a developer to create different solutions in the finance, logistic as well as Supply management, Business Services, retail, Educational Services, Manufacturing, and last but not least information technology. The main advantage of the Webix UI library is the capability to work on the different platforms and it includes both the tools for the process of building the desktop web apps and for the process of creating useful mobile apps. Webix permits the user for the process of simplifying the JQuery, Angular, as well as the integration of the backbone.   It can support server-side technology such as Java and Ruby. The web as well as mobile apps developed with the library of the Webix UI have offline support and is a user-friendly interface and a cross-domain interface of data loading along with other useful features.

Webix JavaScript UI Great Features:

- It can build on the top of the notch and has a maintainable code.
- It can create a cross-platform web along with mobile apps for the users and developers.
- It is known to be compatible with the known and the existing browsers.
