SQL DXP for SQL Server and MySQL v6.6.0.181 (31 Jan 2022)

2025-01-10 10:50:19

It has a cross-platform that compares as well as syncs the schema as well as the data for the servers of the SQL and the MySQL.

Cross-Platform Evaluate

The SQL DXP can compare databases and hence the SQL server to another SQL server the same way that the SQL Delta can perform contrast. It should be added that the SQL DXP moves the information and it can also compare the servers of the database.

Schema Compare

In the schema comparison, the SQL DXP can convert the object of the database source to compare like-for-like MySQL to the server of SQL and transforms the MySQL database. It is very necessary to be aware of the properties and not all the objects could be converted. The MySQL server is not able to support the server of the SQL attribute and it is a schema of the source is off the database that they are right and left.

Data Compare

The data that is being compared can be aligned given the data types are shared. The correspond of the data can provide a handy method to transfer information with the use of two programs.

SQL DXP for SQL Server and MySQL Amazing Attributes:

Task Supervisor

When do user is waiting for the comparison procedure to finish he can review and even conduct an upgrade screen as each method in this case is run in threads.

Data Compare

How does it operate

The process of data comparison usually utilizes the main primary key which has one or more indicators of columns and it indicates and decides whether a raw in its origin can fit into the row of the table and the information is being compared and scans every column whenever the match is found.

Comprehensive Configuration

The data Direction allows the user to choose the right target and the database source and later conduct the comparison process. The SQL delta in this case performs the contrast and decides whether the table with the primary key and the column titles are fine. The user would like to acquire more granular then the user can pick the tables to specify his index columns to compare as well as determine the columns.

Table and Column Mapping

It is a table right at the source of the database which has a different name and the original table name may be mapped by the comparison of data. Wherever an original column can be mapped into a target color the same situation will apply to the column data that corresponds and text care of the title varies.

Data Filtering

所有软件资源 100%安全 已检测 无病毒 无篡改

标签

Tools Database

The data table can get the filter to exclude the rows during the filter and utilize the regular and even the load option in which there are clause formats.

Column Conversions

The columns in this case can be configured to use the conversation for the contrast as well as scripting. For instance, the user may prefer to compare the numerical columns that are capable to shop in two decimal places which are currency worth but in this case, the only numbers that are essential for the user are the whole numbers. The user can use the (..) conversion at the column and prepared the numbers and compare those that our entire and can get rid of the values.

Data Compare Perspectives

As a part of the information of the data compare perspective the comparer view can be included. It is a source of perspective that can be used to a target table and it can supply a way of populating the table goal.

Export Data Compare Scripts

The information is compared with the script and it can be massive and might be stored in the file through the procedure. Data, in this case, compare so that the user will see the set-up of the script, the script which is on the screen and it can show many lines that can set of codes. The user can create and report compared to HTML format.

Automation

On Completion Occasions

Every job in this case has a variety of events that are firing right after the job is run.

Available Occasions

- Mail
- Running of the job after the compare
- Creating a compare report.
- Executing the Script which is synchronized.
- Employing a script.
- Saving the source and targeting as a snapshot.
- Screening the synchronized script
