Security Task Manager v3.2c Multilingual

2026-04-08 08:44:01

Security Task Manager is a powerful tool that will make you view what is actually running on your computer. Other viruses and Trojan horses attempt to be disguised under the appearance of a name that resembles a regular Windows process name. This program helps identify such latent threats and demonstrates which processes are not dangerous, unnecessary, or even beneficial. It even makes you know what could be slowing down your PC.

This tool provides a lot more detail compared to the regular Windows task manager. Each process that is running can display its security rating, comments from experts and users, the results of the antivirus scan, the software publisher, and the complete file location. It may even expose some covert activities, such as monitoring the keyboard or moving the browser. This will allow it to identify malicious activity much more easily than regular tools may.

The **Security Task Manager** also has the smart system analysis, which searches for security risks, error and performance issues, and provides straightforward recommendations on how to rectify them. The full version includes an additional application, SpyProtector, that is useful to block keyloggers, alert against dangerous registry modifications, and erase the tracks of your computer and internet use. It is compatible with most Windows operating systems and requires minimal disk space.

Key Features of **Security Task Manager**:

1. **Advanced process analysis** – Shows detailed security information for every running process, not just basic system data.
2. **Security risk rating** – Gives each process a score to help you quickly identify suspicious or dangerous programs.
3. **User and expert comments** – Let you see feedback and analysis from others about specific processes.
4. **Antivirus scan results** – Displays results from major virus scanners to support threat detection.
5. **Hidden behavior detection** – Identifies activities like keylogging, browser control, or other secret functions.
6. **Full file details** – Shows the exact file path, filename, publisher, and related software product.
7. **AI-powered system analysis** – Finds security issues, errors, and performance problems and suggests solutions.
8. **SpyProtector tool (full version)** – Blocks keyboard/mouse spying, monitors registry changes, and protects privacy.
9. **Privacy cleanup** – Removes browsing traces, cookies, history, and recent file lists from programs.
10. **Low system requirements** – Runs on Windows 11/10/7/Server and needs only 2.9 MB of free space.
