# ComponentOne VSFlexGrid v8.0.20182.321 ActiveX

2025-02-10 19:34:36

Component One VSFlexGrid is considered to be a controller which is very strong and has a full-featured greed available for the users and developers. It has the capability to offer new ways in order to display as well as edit, format and organized and at the same time summarize and finally print the tabular data for the user. The controller of the VSFlexGrid was basically developed in order to be used either in an unbound mode where the grid is basically owned by the information or from the data bound manner, in which the grid is usually being used in order to view and edit the information which belongs to the same database.

## ComponentOne VSFlexGrid Great Features:

It has the following characteristics that are stated as below such as:

- It has a unique support for the hierarchical data I need can be utilized by the user as an outline for the show of the information hierarchy. It basically acts like a tree control for the process of demonstrating the nodes that can be collapsed or even expanded in order to rebuild the branches that contain additional information for the user. Summarizing the trees can be shown in any column and they can even be constructed asynchronously. It should be noted that the appearance of the outline tree can be customized with the help of the properties of Node Open picture.
- It has the ability to provide a 64-bit service to the user and developer.
- The integrated printing capabilities are available and this means that the brand has a new print grid method which permit the user and developer in order to print the grid with the use of a single statement. The user has the control over the paper orientation as well as the margins, even the footer of the text or even display a dialog in order to permit the user to pick and prepare the printer for the process. Printing the events allows the user in order to control the breaks of the page and add the replicating header rows or even add a custom component to each and every webpage.
- Light model in this case means the user program does not need the support of the database and it has the ability to reduce the footprint Dimensions as well as eliminates the requirement in order to spread the ADO DLL along with the program.
- Drop down as well as pop up buttons are available. The Component One VSFlexGrid has the capability to control the screen drop down button mechanically for the cells that are related with the combo boxes or even the drop-down listings. The user has the capability to edit the cells by the click on the button with the use of the mouse. If a user clicks on the button and then the controller is able to fire an event in order to respond accordingly. The user can personalize the picture which is displayed on the bottoms of the mobile easily.
- Translated combos are available and they can be utilized as a dictionary for the data in which the information values are being interpreted for the displaying process.
- Multi-column combos are basically lists that the user can exhibit from the drop-down region right from the list itself the items can have a random information which are attached to them. Automatically it can produce interpreted list along with the multiple fields directly from the record set of ADO and DAO.
- Find a row method permits the user in order to look up for a particular row according to the row data values that are available. The user also has the ability to search the rose depending on the data of the mobile values for a particular column.
- It is highly customizable cell formatting which permits the user and developer in order to virtually customize each and every aspect of the full grid and the respective cells in a visual appeal. The user can find properties that are impacted by the entire grid and others are specific to the coelom as well as a rows. For the complete control over the appearance of the cell the user can use the owner draw property which is available and also the draw cell occasion in order to paint the cell himself with the use of the API cells that are available.
