WcfStorm Rest Enterprise v3.0.0

2024-12-18 23:01:45

WCFStorm.Rest is software designed to help users examine REST services fast and easily, resulting in the accelerated development of new jobs.

The program comes with an easy-to-use, simple interface, which permits users to access its different capabilities with just a couple of mouse clicks.

Thus, the testing of a REST service can be performed in a matter of moments, though all depends on the specific information that users wish to look at.

The tool has been built with support for a wide selection of requests, including GET, PUT, POST, DELETE, HEAD, and OPTIONS HTTP, while also enabling users to combine their tests to projects.

With the help of this utility, users can compare actual and expected responses line-by-line and can also save/load HTTP requests to/from the file.

The program lets users conduct performance tests on their websites or webpages while also supplying them with the possibility to configure various evaluations and create evaluation reports.

The program offers support for auto-plotting of response time and syntax highlighting for HTTP Headers. Also, it allows users to create their own cookies or even edit/delete already existing ones. Scripting support was included in the applications also.

We noticed that the program could deliver fast performance during our testing and doesn't want many system tools for that. On the other hand, the usefulness became unresponsive when we tried to create a performance report, and we had to force-close it.

All in all, WCFStorm.Rest can easily prove a good option for users considering performing REST service testing as quickly and as straightforward as possible. Although it might become shaky sometimes, the program offers a wide range of testing alternatives and support for various request forms and X509 certificates.
